If the phots graphs are short, the articles of set and the facts cathendie, the contribut one will receive appeals attention. Accepted articles will be positively on get for at rear g researches.

### RETROSPECT OF THE YEAR 1909 Exploration

The year 1909 will forever be famous in the annals of scientific accomplishment as having witnessed the successful culmination of the age long quest for the North Pole and the achievement of Commander Roll ert E Peary of the United States navy in finally reach ing this theoretical point at the dome of the world ing this theoretical point at the dome of the world after twenty three years of practically uninterrupted endeavor will stand as the most difficult feat of geographical exploration in the history of the world it was eminently fitting that Peary about the first to reach the North Pole for among all the Arctic explorers he was easily the first in practical procedures as the procedure of the proce knowledge and experience When he announced to the world on September 5th that on April 6th 1909 he had reached the covered goal his word was accepted with out question Sibsequently his data was passed upon Throughly by the National Geographic Scotety of America which later presented him with its medal and the verdict of this tribunal has been tacitly indorsed by the various learned societies throughout the world

In our issue of September 11th commenting upon the freely expressed doubts of Dr Cooks claim that the freely expressed doubts of Dr Cooks claim that he also and a year earlier had reached the North Pole we wrote The man who can look Death full in the face throughout all the cruel sufferings of a two years search for the secret of the frozen North is built upon lines too noble to admit of the slightest subterfuge or misrepresentation. It was evidently with the same conviction that the Danish authorities and the Danish people at large accepted Dr Cooks stupendous claim in a spirit of loyal belief which superanous caim in a spirit of toyal belief which appears never to have wavered until the flasto of the receipt of his so-called data by a committee of the University of Copenhagen. These gentlemen very quickly reported that Cook's statement was the same as that printed in a New York newspaper that the copy of his notebooks contained no original astronom ical observations whatsoever but only results that the documents presented were inexcusably lacking i information which would prove that the astronomical observations therein referred to were really made and that they contained no details regarding the practical work of the expedition and the sledge journey which would enable the committee to determine their relightlity

By this sweeping repudiation of Dr Cooks claims the University of copenhagen has drawn the final cur-tain upon one of the most spectacular dramas of auda clous imposture in the history of geographical re-

Second only in importance to Peary's achievement in eaching the North Pole was Lieut Shackletons we derful journey in the Antarctic when he succeeded in reaching latitude 88 degrees 28 minutes south and arrived within 111 miles of the South Pole Shackleton passed the very point reached by Scott in 1903 pushed on for 325 miles and was defeated in his ques pushed on for 125 miles and was defeated in his quast by hunger frique sickness and the loss of his dogs and ponies. He discovered eight new and distinct mountain ranges and over one hundred mountains and ascended Mount Erebus the most southerly vol-cano. The south magnetic pole was resched at 72 gagrees 10 minutes.

## Civil Engineering

With the single exception of the harbor at Dover the part year has not been notable for the completion of any engineering works of the first magnitude. This supendous work by which a harbor capable of float-

ing a whole first of the largest warships has been
"wrested from one of the storminet mas in the vorsit,
constate of an aggregate length of ever two miles of
breakwater much of which is nearly 100 feet in
height from its foundation to its creet It inclease
about one equare mile of area and cost some twenty
milton folders.

In spite of many predictions of failure the United States government through its army engineers, is building the Panama Canal with a rapidity which augurs well for its opening by January ist, 1915 Over augnra well for its opening or January In., 1910 over one half of the excavation at the Culebra cut has been done and if we include the work done by the French the out may be considered as two-thirds completed on the Atlantic side between three and four miles of the entrance channel have been completed and on the Parific side the channel is open to full depth for about five miles At Gatun the lock excavation is so far done that the laying of the concrete floor and the building of the walls is well under way and over eighty thousand cubic yards are already in place. The cut for the spillway has been completed and here concreting is making good progress. The method suilding the Gatun dam by hydraulic depositing is being followed with every promise of securing a per fectly watertight structure The locks which will be in pairs will be 110 feet in width with a usable length They will be provided with an extra pair of heavy mitering gates to act as collision bulk heads. Plans have been completed for an emergency dam at the head of the locks which in the event of dam at the head of the locks which in the event of a gate being carried wary will be symma arous the entrance and wickets resting on girders extending from the bridge to sills below will be associately low ered until the flow of water is cut off Throughout the whole length of the canal the method of excernation by stoam shorel has been ominently successful and during the month of March a maximum record of excernition was reached of 1880 off 10th yards. The health oon was reached of 2880 487 tubb, yards The health con-ditions have shown steady improvement and the rate of sickness and mortality is now less than in some parts of the United States The increasing size of ships both merchant marite and naval has led the German government to undertake a great colargement of the Kaiser Withelm Canal which is to be despi-and to 16 feet. With provision for a later desputing if necessary to 46 feet. The width of the small is to be doubble and the locks will be 147 feet broad 46 feet deep and 1082 feet long During the year work has progressed steadily if somewhat slowly upon that other great work of canal excavation known as the New York State Barge Canal While it must be ad mitted that there can be no comparison on the score
of accommodation between a canal 12 feet in depth with one 45 feet deep it must be remembered that whereas the Panama Canal is but 50 miles in length whereas the Pansam Canal is not by miss in length from deep water to deep water the New York Barge Canal extends for nearly 400 miles On June 23nd the first sod was turned in the work of cutting the Cape Cod Canal which will extend for eight miles from Barnstable Bay to Bussard's Bay It will have a sur face width of 300 feet a least depth of 25 feet and a high water depth of about 30 feet. The sailing dis-tance between New York and Boston will be shortened and vessels will avoid the perils of the outside trip and vessels will avoid the perils of the outside trip around Cape Cod Furthermore it will serve as the first link in a chain of interior waterways by way of Long Island Sound New York Bay and the Baritan and Delaware Rivers to Chesapeake Bay. During the year the agitation for the construction of a waterway from the Lakes to the Guif has been exceedingly attacked authory the advocates of this great scheme were dis-couraged by an adverse report of the board of govern ment augineers appointed to investigate the problem This board reported that although the construction a 14 feet channel was feasible there was not suffer a 14 foot channel was feasible there was not emfloset traffic in sight to warrant the expenditure of the \$100,000,000 that the whole project would feat The street Los Angeles Aqueduct which contains of the Panama and State Barray canals is the largest by Tenanic angiestering work in progress is now about habit concepturing work in progress is now about habit concepturing work in progress is now about habit concepturing work in progress in the street habit concepturing work in the progress is not about habit concepturing 200,000 to galaxies of water part day. The property is 200,000 to galaxies of water part day. from the Sierra Nevada Mountains over the Mejave Desert to San Fernando Valley where it will provide water for city supply for power and for irrigation.

Throughout the year the work of the United States

The substitution of the following state of the work on control to the following state of th

which has been driven through the cosentales and in new being used to diver the Giuninos River little the furtile Uncomplays Valley.

The hereulean tests of howing out of the solid rook of Manhattan Island the assoled spales for two of the larguest relivery terminal stations in excisence, and building within and upon them dequate tests aped and terminal accommodation has proceeded appear during the past year. The Fenneylvanial Terminal is precinally completed as are also the commerciar tra-sis with New Ferrey and Long Island. The present open for public use early in the summer of this year to work of contraction which had been temporarily all but suppended on the New York Central Terminal has been proceeded with new larger during 1000 that has been prosecuted with such vigor during 1909 that all but two tracks of the old train shed have been re-moved and the rock excavated to about 45 feet below moved and the rock examined to about 45 feet below the street level It is greatly to the credit of the engineers and contractors that the gradual transfer of transis from the old to the new Ireal has been made without the elighteet interference with traffer. The difficulties of the work ands it likely that three pears with chapes before it is entitlely completed. The exten-tion of the complete of the complete of the complete and the complete of the complete of the complete in the complete of the complete of the complete in its entirety the downtown tunnels from Jerny City. To Cortlanti Storet having been put in service during In its antirety the downtown tunnels from Jersey City. Occasion of the Continued Street having been put in service during the year. A franchies has been granted to the company for an important extended from Static Arente and Staff Street to the Grand Cantral Station. This important connection will enable passengers from New England to the South and West to travel by rail from the Cantral Station. the Grand Central Station to the trunk line termi

stations in Jersey City
The close of the year witnesses the practical comple-tion of the Manhattan Suspension Bridge across the Bast River which is now spanned by four out of the five great ions gene bridges of the world the first being the notable Forth Bridge in Sociand The Manhattan Bridge which is of the suspension type has the larg est carrying capacity of any bridge in the world pro-vision being made for four rapid transit tracks four surface tracks one 35-foot roadway and two 11 foot footwalks. The main span measures 1470 foot and the pointed to examine into the question of the safety of the bridge pronounced this great structu thoroughly adequate to carry the loads imposed. The thoroughly adequate to carry the loads imposed. This structural modifications recommended by the commission which investigated the Queenabore Cartilever Bridge over the Beat Riter with a riw to decreasing the total dead and live load have been made and this involved and perfectly asis for the modified loading adopted. The commission of angineers which have the re-designing of the Queboo angineers which have the re-designing of the Queboo Bridge in hand are still at work upon the p ar yet no statement has been made either as to the character or capacity of the new bridge although we understand that there is a possibility of the suspen ston type being adopted in preference to the canti-lever—a was substitution

### Naval and Military.

Progress during the past year in matters naval and military may be considered as decidedly satisfactory Several ships have been completed chief among which are the South Carolina and Michigan the first are the South Carolina and Michigan the first all biggens betterlies for or many. These vessels which are of 16 000 tons displacement carry each four the called 18 lines guar The Michigan on her official trial maintained an average speed of 18 97 knots. The Delaware and North Dekota freedomogsts of 50 000 tons displacement carrying each ten 18-inch The Dalaware and North Dalcots dreadnoughts of 3000 tone displacement carrying each test 18-inch 45-celliber game and fourteen School game have passed through their trials successfully the Dalcware' driven by reciprocating angines averaging at full proves a speed of 11 of kpots and the North Dalcots driven by Certification and the North Dalcots are not consumption of the turbina-driven ship at ernsiping speed to the three processing to the "Daylots and the "United States of the Speed and the "Thought and "Thoug

5

gin to spars.

The new 1-14-nch 80-caliber type gun, of the kind which is to be mounted in our \$8,000-ton ships, has shown, in the Priving Ground tests, an initial velocity of 3,000 feet per second and a mustle energy of 5,500 feet per second and a mustle energy of 5,500 feet, per second and a mustle energy of 5,500 feet, per second and a mustle energy of 5,500 the how the heavy gun, recently completed at the hidden works, which will fire a 1,000-pound projectile with a mustle sourcey of 6,500 feet. The new army 1-61-of-th gun will be less powerful, but its accuracy life will a gun will be less powerful, but its accuracy life will be greater it will be capable of firing 250 rounds, as against 80 to 100 rounds which is the limit for the present high relocity 12-inch army gun. A compari-son of the sea strongth of the powers at the close of the past year places Great Britain first, the United States many third, France fourth, and Jape When all ships now building are completed, Germany will be second with \$20,892 tons, and the United State third with \$29,892 tons, and the United State third with \$29,887 tons displacement. In dresdnoughts Great Britain stands first with seven completed, and nine building, Germany second with two completed, and nine building, and the United States third with two completed, and four under construction Of predreadnought battleships carrying guns of 11 inch call-ber or over, Great Britain has forty nine, the United States, twenty-five, and Germany, fourteen.

### Merchant Marine

The deplorable decadence of our merchant marine has continued throughout the year, and we look in vain for any adequate evidence of the awakening of vam nor any acceptance of this pre-eminently na-tional question. As a measure of security and defense, the existence of an adequate number of merchant ables to serve as transports and colliers in time of war is tital to the efficiency of our navy Although, during the world cruise of our feet, the world looked on aptas worn cruise of our neet, the worn looked on ap-provingly and applicated this evidence of material strength, the people who know—the naval boards of strategy and naval officers in general—must have smiled as they realized that, because of our want of transports and colliers, a voyage of this character would never be seriously contemplated by our naval would never be seriously contempason by our board, and certainly never attempted. The signs of decadence of our merchant marins are so clearly writ-ten that he who runs may read. Within two years the number of American steamers crossing the Pr and capable of carrying the mails has b more than one-half. The year before last the Post Office Department recommended, and the Senate assed a bill providing for a compensation of so much or mile to steamers running to South America, the per mise to seemers running to South America, the Philippines, Apapa, China, and Australia, but the measure failed to become inv. It is certain that with-out such federal escouragement American stammhly lines will naver be established, and until the construc-tion of mail steamers and freighters is encouraged, our splendid navy will be robbed of its efficiency and itmited, at least in the opening months of a war, to

minuse, at sear in the opening months or a war, to the detense of its own ports.

The past year will be notable in the annals of trans-athanic traval for the fact that a transaliantic liner made the passage for the first time at an average speed of 36 knots an hour. This was accomplished bilt October, when the "Mauretania" covered the westhist October, when the "Hauretanist" correct the weat-ward course from made to lead in 4 days, 10 hours, and 11 phrotos, at an average apped of \$4.00 knots. Both 5th resists and ler sitest, it. Touristanis, "are now objects of \$2 hours sessioned speed in average weather and \$5% knots, foreign the quiet weather of the sum-session of \$10 knots sessioned speed in average weather \$10 knots, for \$2 knots sessioned appeal in proceeded again, \$10 knots, and \$2 knots, and also will projectly should, the "Victoria" and "Ultrapple," has proceeded and will projectly saidly her first trip \$1.910. The dissen-sions of these both, as a phenomial for \$50 coursilor, are: 100 first order \$50, \$20 knots, and as the property of the said of the said of the said of the \$10 knots of the \$10 knots of \$10 knots of the \$10 knots of the light speed of \$10 knots of the \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots of \$10 knots of the hallow-ted said \$10 knots of \$10 knots

enditution of four-bladed propellers of smaller diam-er for three-bladed propellers on the outer shafts of the Cunarders has not only completely eliminated controllecture may be a first comparison to the considerably increased the speed. There is no ordences that any company will intempt to rival these vessels in speed, and probably future development will be along the lines of the "Olympic" and Tritanio," These moderate-speed vessels are to be driven by a combination of reciprocating engines and fritanio that have not been appeared to the second that the turbine. In a recent trip to Now Zaland a merchant vessel, the "Olympic" side with engines and turbines, made the same average speed as the sister shape "Onter" and "Opeava," fitted with engines and turbines, made the same average speed as the sister shape "Opeava" and "Opeava," fitted with reciprocating engines about. Her cost consumption per cent in the water consumption, all three ships having the same bother installation. In this combination, when reversing, the turbine le cut out and the t vibration the re was, but by improving propelle having the same boiler installation. In this combina-tion, when reversing, the turbles le cut out and the reciprosaling engines are connected directly to the condenser Toward the close of the year two inter-esting devices, designed to reconcile the slow-speed demands of the propeller with the high-speed demands of the turbles, were made public. One, designed by Admiral Mevilles and Nr McAjine, consists of a re-Admiral Melville and Mr McAlpine, consists of a re-duction gear of the helical type interposed between the turbine and propeller shaft. The other, designed by a German engineer, employs a form of hydraulic turbine transmission, in which the ratio of turbine speed to propeller speed can be varied indefinitely For both devices a high efficiency rate is claimed. The For both devices a nign emiciency rate is cusined and Curtis turbine, because of its large diameter, and comparatively low speed of revolution, has less trouble from propeller inemiciency than the Parsons type The loss of the "Republic" early in the year gave dramatic evidence of the value of wireless telegraphy as a safeguard to the safety of passengers and ships. It served also to draw attention to the question of bulkserved also to draw attention to the question of Duk-head protociton. Theoretically, the "Ropublic" should have stayed afoat long enough to be brought into port it is probable that she sank because of the gradual failure of her buikheads, one by one. On the other hand, the value of buikhead protection was proved by hand, the value of builthead protection was proved by the fact that the colliding ship, the "Florida," with 30 feet of her bow crushed in, was able to make port in safety. An important event for the navigator was 35 feet of her hew crushed in, was able to make port in asfery An important event for the awigator was the launch of the magnetic survey year. "Greeke" and provided the property of the state of the magnetic material entered Rhe was built for the Carnagie Institution at Washington, and her surveys of the common state of the c An interesting novelty in hull construction was seen in the "Monitoria," whose hull is built with large cor-rugations, the object of which is to increase the longi tudinal strength of the ship, without increasing the weight. The extra cost is slight, and the carrying capacity is said to be increased from three to four

The most surprising fact in railroad development during 1909 was the continued and very considerable during 1969 was the continued and very considerable increase in the size of passenger and freight ideometries. So marked has this been, that we have ceased to hear anything of this about the 'llmits of size as he ing been surely reached." The adoption of the Mallel articulated system has made this increase possible Two locomotives built by the Baldwin Company may be quoted as instances of this construction. A freight commotive for the Komutain Division of the Scotlern locomotive for the Mountain Division of the Southern Pacific Railway, built a few months ago, has 6,333 square feet of heating surface, the engine weighs 213 tons, and, the engine and tender together weigh just under 300 tons. Toward the close of the year the same company built for the Atchien, Topeka & Banta Fé Railway a still larger loo notive, with 6,631 square feet of way a still larger locomotive, with 6,631 aquare feet of heating surface and 1,745 square feet of superheating and reheating surface, the engine alone weighs 231 tons, and the engine and tender together 350 tons. tons, and the engine and tender together 350 tons. The most howely and important departure in the new passenger engines of the year is a buge Millet 15-wheel locomotive, with two high-preserve 35-inch cyclinders driving six coupled 75-inch wheels, and two Shinch low-pressure cylinders driving four coupled 75-inch wheels, and two sixth wheels. The total needing surrhoes is 4,750 squares feet, and there are 1,111 squares refer of experiments and reflecting surrhoes. The engine weight 135 tons, and the engine and tender together 950 tons. Buth an engine will be able to haul the exceedingly heavy American express trains at a rate of speed equal to that of the lighter European trains Most encouraging their of the lighter European trains. Most encouraging has been the great improvement in the quality of steel ralfa delivered from the rail mills. Reports of the Public Service Commissions of New York State, show that whereast during the winter of 18074 threelywest £17 ceases of rail finityre spoored, during the Winter of 18095 the total number was £1250—a better show-ing, but harders room for much further improvement.

It is encouraging, also, to note a decrease in the num-ber of railway accidents. This is due in some meas-ure to the increasing application of the block signaling m, which now, except for a few short distances totaling about 100 miles, extends unbroken from the Atlantic to the Pacific coasts. Great activity is also being displayed in the development of various forms being displayed in the development of various forms of automatic alguainty, and particularly of that class of devices which acts directly on the train, and presents some visual or audible signal in the engineers cab. A device of this character for automatically and argualually applying the air brakes was recently sasted on the Eric tracks with excellent results. In spice of the deversal statement of the formation of the formation of the several statements of the practical application, the monorall system is making but alow progress. The literature of the several statements the state of the contraction of the several statements of the several statements and the several statements are sentenced to the several statements and the several statements are sentenced to the several statements the several statements are sentenced as the second statement and the second statements are sentenced as the second statements the second statements are sentenced as the second statement to the second statement and the second statements are sentenced as the second statement and statements are sentenced as the second statements are sentenced as the second statement and statements are sentenced as the second statements are sentenced as the second statement and statements are sentenced as the second statemen latest, and as far as experimental tests so the most ing, is the Brennan gyrostatic railway, which promising, is the Brennan grostatic railway, which is receiving support in Europe, notably from the officials of the British army. The little experimental car exhibited in the surping of 190° has been followed by a full-stude car, weighing 21 tons and carrying a lost of 40 passengers, which has made successful tipe on an experimental track. The present indications are that the system may find useful application on light railways, acting as feeders to the main steam or six-

### Astronomy, Photography, and Chemistry.

The year 1909 is astronomically memorable for the return of Halleys famous comet. On September 11th last, Dr Max Wolf of Heidelberg discovered this Aistoric wanderer upon one of his photographic plates in almost the exact position which the calculations of Cowell and Crommelin called for—a feat which may be regarded as a triumph of mathematical astronomy The comet will pass perihelion on April 20th, and will be a conspicuous object in the western heavens after sunset about the middle of May, at which time the earth will pass through a portion of the comet's tall, and the comet itself will cross the sun a disk The reappearance is therefore of exceptional interest because it will give astronomers an opportunity of obtaining much valuable information as to the comet's structure

The year was further signalized by the discovery of

another come by Mr Daniel of the Princeton Observa-tory—the third he now has to his credit.

On September 34th, 1969, an opposition of Mars occurred—the most favorable which astronomers can possibly have for another fifteen years. On that date the planet was distant 35,500,000 miles. Naturally the old question of Martian habitability was revived Prof Pickering, in order to settle it one proposed a method of signaling by mirrors, and Prof Wood of Johns Hopkins University suggested a method of "winking" by means of black cloths on reels Neither astronomer probably believes in in-telligent life on Mars, but was actuated solely by a desire to close a wearisome, perennial debate. The theory of habitability depends very largely upon the presence of water on Mars. Dr Campbell, director of presence of water on Mark. Dr Campbell, director of the Lick Observatory, made a careful comparison last year of the spectra of the moon and Mars. He found that there was no appreciable difference between the two, from which be infers that Mars must be pre-tically waterless and therefore as dead as the Moon. Very, of Prof Lowell's staff, on the other hand, has arrived at a directly opposite conclusion. So far-from being decided, the old question is therefore more alive than ever

ere were two eclipses of the Bun and two of the

There were two extipues of the Stud and two of the Monon. The intra evilipses were both total and co-curred on June 2rd and November 26th. The eclipses of the Stud. occurring on June 27th and December 13th, were respectively restral and partial. As might to expend to, the radiosative sleements attill continues to suggest the attention of chemistry and the students of the students scaled up some radium bromide in a bottle togeth with water, and observed the regular evolution of the service and the service of the servi er, and observed the regular evolution of the The work of Soddy for 1909 has she

### OXTOR AND RULAR RUNNY.

ar some a numer, and no Oxygen is the life-maintaining gase it is the most reful and the most abundant of all the elements as we still call them Its combination with other sub-stances—oxidation makes heat and that is why the sentient body is generally warmer than the atmosphere about it. All animal and vegetable life depends took oxygen under the sun a benignant influence the plants give out this gas which thus from the plants give out this gas which thus from the plants give out this gas which thus from the plants give out this gas which thus from the plants give out this gas which thus from the plants give the pla

the physiological sense we mean not only the series of acts known as mean not only the series or acts known as breathing lut also that in respiration oxy gen is carried from the lungs by the blood, through the minutest capillaries to the ut termost cells and the most microscopic tissuce of the body giving to it strength and warmth and life

In potat of fact lift itself in our present knowledge is fince ivable without orgress, which is much more important than food to the human scooning. Without the latter one may crist for mosths without the for-mer one must side within a few minutes (onsider also metabolism Normal metabo-lism is the port's chemical transformation of sayen fluids and food stuffs into bealthy itseuse The process is a near rest ing an ever changing one Nespiration pre-ling an ever changing one Nespiration pre-lined and the food stuffs. And is that in finitely complex ishorstory the animal host, three substances are combined in the co-In point of fact life itself in our nee these substances are combined in the con sinut manufacture of fresh cells and tissues state manufacture of tream cells and tissues to take the place of those whi h are as constantly dying and being removed by way of the lungs ( arbon dioxide and watery vapor) and the ex retory organs

We are thus able to appre late one of the most valuable dicts of the evolutionists that normal living is the right adjustment of internal relations to external relations again whatever an cunt of power an organ again whatever and that it power an organ ism expected in any shape is the correlate and equivalent of a power that was taken in from without in our physical life—as also in our psychi for that matter—we are absolutely dependent upon a wholesome en vironment for wholesome existence and by far the most essential and the most benefi-

far the most essential and the most neutro-cant element which our environment affords us is exygen it is here very important to note that nature does not you haste us this exygen jure she has tempered it for our use by combining about one part of it with about four parts of hirogen (an inert component) Oxygen pure is irritating and ozone a form of oxygen in which three atoms are considered to be condensed into two—has in experi consistence to be canonised into two-main in experi-ments been found so causilt as to produce pulmonary it flaumations. The safest and the only good and right form of oxygen inhalation for normal restures is in ombination as it exists in the stmoephere for this is the form to which during many ages the race this is the form to which during many ages use race has become adapted it is possible that in other some creatures respired oxygen under a different combina-tion than that which now obtains but in those scone there were no human beings—only such creatures as ichthyosauri and the dodo No we can live most advantageously most wholes mely and with the best

human results only in conformity with natural laws as we find them, and with due restect and remard to

There are however abnormal states of the human body in which oxygenation is deficient by reason of disease processes and in these diseases it is sought to administer oxygen in greater proportion than obtains in the ordinary atmos phere We give it thus when oxy phere We give it thus when oxy g nation of the blood is interfered with as in dyspaces em; hysems asthna croup whooping cough as-phyxis tuberculosis and pneumoand when the oxyge tion in the blood is poor as in ane min diabetes and chlorosis (the ings are I b lieve a sthoritative In such diseases as those just men tioned says n mir d with a deter-minal quantity of air energizes to a considerable legree the nutritive slightly elevates the temperature stimulates the cardiac movements and augments the bodily weight the number of red blood cells is in creased and their organic activity is stimulated although this setion

ts not constant, the effects suby become so greater nutritive changes that are thus promo Observe now the portion of Hayems statemen I have italicised. In point of fact even in dis ent which I have italicised. In point of fact even in disease we do not as we could not, administer crypten pure, moreour the nurse in administering holds the tube in sand manner between the parted lips that some admirture of air takes places this admirature is essential if the corporate is to be respired at all. Nor have I, her my

THE SCIENTIFIC AREAION TROPEY
THE SCIENTIFIC AREAION TROPEY
THE SCIENTIFIC AREAION TROPEY
The year 1969 has closed with only at size trial for the Scientific Assessment by lag Machine Trophy and Assessment by lag Machine Trophy and the present time Mr Glonn Curties to his result, is the only American value for his result, is the only American value for head considerable expanse for the purpose of concerning the development of an activity has been been also been also been also as a considerable expanse for the purpose of exception of the purpose of the

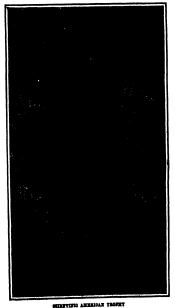

holiopoters and besting-wing machines, would receive encouragement. The conditions required at first were a straightnway flight of one kilometer (0 611 mile) a straightaway mgat or one amounter (0 531 miles) in a straight line. On July 4th, 1908, lif (9 6mn Ourties carried off the Trophy by covering somewhat more than a mile in the "June Buy. I nive or the slights which were then being made by French aviators the conditions were changed for 1909 to 28 kilometers (15% miles) in a closed circuit, in other words 5

AN AUTOMATIC APPARATUS FOR PROJECTING PICTURES.

N.

kilometers (8.1 miles) more than required in the Inter-national Contest for the Bennett Trophy Under the 1000 rules the winner for any year is the aviator who makes the longest and best flight in a closed circuit during that year In 1000 Mr Curtias was the only makes the ongest and near man in a smeat circuit during that year. In 1909 Mr Curitias was the only competitor who came forward. He easily complied with the conditions and sacordingry he must be regarded as the winner of the Trophy for the year 1909.

Wate he mad need her by Claim II. Curties.

His achievement is remarkable, because he flew double the distance required in the Bennett (up Race The lack of entries for competition during 1909 was certainly not due to formidable conditions as the certainly not due to forminance conditions as one Aero (lute, in establishing the rules for the year of deavoned to make them so easy that any asplring or perimenter would feel that the Trophy would be well within his reach. The discouraging fast manine that during the past year in spite of the notable a hiere ments of Curlies and the

in spite of the notable a hiere ments of Curies and the Wrights very few new men have come into the field Re-ports reach this office from various parts of the country that machines are being built but successful flights are few and but successful nights are reward far between In France during the past year the science of avi ation has advanced by leaps and bounds as was witnessed by the successful flights at Rhelms and Juvisy and by the almost daily reports of successful trials of reports of successful trials of new machines or long cross country flights by well known aviators There are fortunately a number of men in various parts of the country who are making serious experiments and it is to be hoped that great strides will be made during the year 1910 and that the competi-tion for the Trophy will bring into the field a large number of

Possibly the present lack of progress is due to the fact that in America at least the aero plane is not as vet what may be called a ommercial

product It was not until the automobile had become a serious competitor of the horse drawn whicle that the Bennett and Vanderbilt cups and other automobile tacing trophies were samestly comp ted for Perhaps the history of seronault sport may be the same and that when seroplants are manufactured wholesal the flying machine will hold a recognized position in the sport of the country in France we believe there are no less than a dozen

establishments actively engaged in the making and selling of aeroplanes. This placing ing and selling of aeroplanes. This placing of the firing makine upon a commercial footing undoubtedly has played its part in populariring the monoplane and the biplane among Frenchmen. For all that however there must have been popular cuttusiams before the industry could have been started—an incentive which was not that of making money. We hope that in 1910 Mr. Cutties will asset his accommendation than the commendation of the second selection. tiss will again be a competitor that he will self against men who are worthy of his steel and that a contest will be inaugu rated which will arouse in this country something like the enthusiasm which was evinced at Rheims

ditions which will go tasts for the cup in 1910 will be announced later They will be so drawn as to keep pace with the progress made last year

A table prepared for the Archiv für Eisen states that at the commen ment of 1908 the total railway mileage of the whole world was 594 842 miles divided the whole world was 54 542 mires divided as follows America 302 928 Europe 199
346 Asia 56 284 Africa 18 518 and Austra
lia 17 786 The cost of construction per mile has been highest in Great Britain and Iroland where it averaged \$271 000 per mile Iroland where it averaged \$271 000 per miles in Belgium the cost was \$172 900 France \$122 000 Germany \$108 500 Italy \$12 000 Russia \$479 600 per mile in the United States the average cost has been \$48 800 in New Zealand \$486 300 and in Queensland Australia it is as low as 884 200

as successfully operated from a small book at at a demotor was started and stopped at will and the round was successfully operated from a small boat at a distance of a little over 100 yards. Mention should also be made of experimental wireless communications with a balloon, made by the United States Army Signal Corps by means of a 100-foot phosphor-brones wire suspended below a balloon 1,000 freet in the air Communications. munication was kept up from the Washington station until the balloon was about six miles distant, and messages were received from Annapolis over distances messages were received trom of from twenty to ten miles

The application of electric traction to steam rail-The application of electric traction to steam rati-reads continues to show gratifying results. Although no figures have been made public as to its economy, the electrical operation of the suburban tracks and termi-nals of the New York Castral and New Haven lines make of the New York Contral and New Haven lines has been carried on throughout the year with unbrahen success. The New York Central electric sons to long extended to White Paina, and the New Haven Company are building a mile of experimental overshead line beyond fituanford, preparatory to the extension of the system to New Haven. The latter company have also ordered two experimental relight becomotives, and it is the intention to operate the whole time from New York to New Haven, a distinct of manyly eighty military and the state of the contral time of the motor front to and and placing it shows the the motor from the axie and placing it above the frame, with a view to raising the center of gravity and g the stresses on the track and roads tion should be made here of a most important enlarg ment of the capacity of central power stations by the introduction of low-pressure turbines between the lowpressure cylinders and the condensers, in such power stations as are now operated by reciprocating engines. In the 59th Birset power sistion of the New York subways the maximum output of 8 000 kilowatts of the

16,000 kilowatta by interposing a Curtis turbine in

Groat as was the advance made in aeronautics dur-ing 1908, it was far surpassed by the extraordinary developments of the past year, and when the history of this new art comes to be written, the sensational performances at the Rheims meet, and subsequently, will be referred to as marking the era of practical and thoroughly controlled human flight with the heavier than-air machine. On July 30th, Orville Wright completed the government tests at Fort Myre by flying for ton miles across country at an average speed of 4285 miles per hour with a passenger about, having previously made a flight with a passenger record, having previously made a flight with a passenger over a minute. The miles of the property of the control of the minute price of \$80,000 What has probably the most popular performance that probably the most popular performance of the year control of 1417 fifth, when Bierlet made he monosaful 11-miles fight across the Biglish Channel. At the great Rheims meet, which opened on Armel 220nd, no less than 38 seroplases were entered, of which 18 made successful flight, there being about an equal number of biplanes and memoplanes represented. Here the public witnessed the astenishing sight of as many as half a down seroplanes in the air at one time, pleted the government tests at Fort Myer by flying Here the public witnessed the autonishing sight of as many as half a dosen seroplanes in the air at one time, the pilots of which showed perfect control of their ma-chines in the gusty winds that prevailed Both Bleriot and Curties proved how near the aeroplane had come to reaching the 50-mile-an-hour mark, the former winning the 621-mile race at a speed of 47.78 miles hour, and Curtiss bringing home to America the In hour, and Curliss bringing home to America the in national Cup by covering 1243 miles at a spet 4704 miles per hour. That the seroplane poss-endurance as well as speed was proved by Far who won the long-distance race with a record of 1 who won the long-distance race with a record of 111.88 miles covered in 3 hours, 4 minutes 552/5 seconds. Bubsequently to the meet, Farman, on November 3rd, at Mourmelon, France, made a bold bid for the Michelin Prise, held by the Wright brothers, by covering 144 miles in 4 hours, 17 minutes, and 53 seconds, and since, at the present writing, there is no indication that the Wrights will make an effort to retain the cup, it must perfore be returned to France During the It must perform be returned to France. During the Indono Fulson Colebration in New York, William Unique Delication in New York, William Unique Judicia in New York, William William India in the reliability of his machina by fright from Governor's lained up the Hussen River to Grant's Tomb and back again. Barly in October Orrillo Wright in an enhaltion at Footdam Cormany, rose to the unprecedented height of over 1,800 for a few Hussen River in the Commany, rose to the unprecedented height of over 1,800 for a few Hussen River in the Commany of from Juvissy to Paris and back, a distance of 30 miles, during which he flew above the Elifel Tower An en-couraging fact, pointing to the more complete mastery of flight, is the increased assurance with which ariators are now making their flights under unfavoral ators are now making their flights under unavorance weather conditions instances of this occurred both at the Rheims and at the Blackpool meets, when Latham passed successfully through heavy thunder squalls and also drove his machine around a closed ruit in the face of a wind which was heavy enough at times to bring him almost to a standstill altogether, it must be admitted that the honor altogether, it must be admitted that the honors of the year are about equally drieded between the monoplane and the hipkans. Puture developments will be in the direction of improved devices for starting and alighting, and the monitor stability. A most encouraging reaching the monitor stability. A most encouraging fearer is the present orduction which had been made in the weight of the seroplane, Certifer's machine which is credited with a speed of over 50 molecules. Which is credited with a speed of over 50 molecules. Which is credited with a speed of over 50 molecules. Which is credited with a speed of over 50 molecules. Which is credited with a speed of over 50 molecules. Which is credited with a speed of over 50 molecules. Which is credited with a speed of over 50 molecules. Which is credited with a speed of over 50 molecules. The state of the st ing more than the necessary low mines in a cuse-circuit, won the Scherriere American trophy for the second time, his first success being scored in 1908. It is a strange anomaly that there should have been but a single competitor in the country which gave birth to constul sero

In its own field the dirigible has made preportional preparable the inspect and its endurance. Count Zepolius with his powerful dirigible "Expella IIII" is fastlend of all competitors; and his journey from Pieririchabaden to Berlin and back, a total distance of zero mine, was a fine performance, and reddends to the everlasting oraclit of the velocial investor. After Marking how to fly a Curtiss biplane and maker personal excellent flights at Hammondsport, N. Y al excellent flights at Hammondsport, N. Y., at of which lasted 25 minutes. Charles K. the longest of which lasted 25 minutes, Charles K. Einglifton made some daring flights at St. Joseph, Mo, recently, as detailed below by our correspondent. The insolubse he is using is the same one that Mr Curties used at Governor's Island, New York, when he atused at Governors limind, New York, when he at-tempted to fit there during the Hodson-Pulton celebra-tion. It is fitted with a 25-horse-power 4-cylinder water-cooled motor, and the planes have a 30-foot spread. The machine weighe some 560 pounds, The first flight at 8t. Joseph was made on Sunday,

mber 12th, over a circular course above the from December 18th, over a circular course shows the frozon surface of Lake Contrary. After two straightaway slights of a half kilometer against the wind and a kilometer with the wind. In order to test the motor, the highane assended in a snow storm so intense as to be hinding to the spectators. The velocity of the wind stored and the stored of the first contract of 40 reet was maintained inrougnout the one and a half times around the course—five miles—except when nearing the Casino, a summer opera house that juts out into the lake. This forms the "seroplane grave-yard" of the course. On Tuesday, December 14th, a trial in the field inside the race track was made. The wind was blowing a gale of 30 miles an hour estimat velocity A start was made over ice, snow, and weeds of the infield. The machine got off the ground under these adverse conditions, but made a 100-foot flight only. A new carbureter had been put on the engine and a 4-bladed propeller substituted for the 2-bladed one. A bad spark plug gave trouble throughout the day. Later the machine was wheeled to the lake, and a start made from the los. The aviator feared the a start made from the ice. The aviator feared the demolishment of the machine, and held close to the surface A piercing northwest wind swept the ice, and during the two flights a speed of 63 miles per hour was made with the wind while flying near the west shore. The timing was done by Mr. J. H. Heas, and the distance was measured by your corre-

spondent. Wednesday was a day of failure, owing to motor trubble and unfavorable winds, until a late hour in the affaracon, when two trials were made over the fail within the race track. The first was a very short flight, and the second resulted in breaking two support brices of the borisontal rudder. The manager of the light support brices of the borisontal rudder. ciation insisted that the starts be made from the field within the race track. This was an undulating sur-face covered with ice and snow, and only 1,250 feet

long.
On Thursday, after the 3-bladed propeller had been replaced and the old carbureter refusalized, the machine was taken to the take once more A stiff north west gate delayed flight until late in the atternoor would be the stiff of the course was accomplished with made. A circuit of the course was accomplished with made to the course with the course was accomplished with the course of the course was accorded to the course of the course which was a course of the and the machine was stopped so suddenly by the ap plication of the brake that it skidded completely around on the ice This resulted in breaking the co-ment of the tires and almost ripping them off Later, when the second flight began, after covering 600 feet motor started missing, and while passing through drift two tires were thrown, locking one who through but notwithstanding this, the machine again rose and covered 1,000 feet. The motor picked up in the mean-time. Altogether, some remarkable feats were accom-

O the Editor of the SCHETTIFIC AMERICAN

Following closely on the heels of the article in the Following closely on the heels of the article in the CERTITIPA MERICAL STRING THE NEW Y. B. SELISHED, "North Dakota" the proof title of "Fastest Dread-nought Aflast", there appears in the columns of a Canadian publication of the first class a statement to the effect that Parithal "Dreadoughts" are known to make an average of over 28 knots an hour while the maximum average made by the "North Dakota" is below 22 knots an hour If the exact fayrure relating to Great Britain's naval

affairs are not very generally known, may it not be that she, perhaps more wisely, prefers not to publish to the world her naval secrets, while Americans, in justifiable pride over their achievements, are making ill-advised haste to claim the first place in the prog-ress of naval science. We have a right to expect the perfection of accuracy in all matters treated of in the pages of the Scientific American M W

Stanstead, Queb [The "Dreadnoughts" referred to as making over 23 knots are probably the cruiser-Dreadnoughts of the "Invincible" type The "North Dakots" is of another

OF BARTE'S ROTATION ON STRONGOPIC CARS. To the Editor of the SCIENTIFIC AMERICAN

I take much pleasure in reading your paper, and be It uses much piesures in reasong your paper, and or-ing a railroad man, was especially interested in the article describing the monorali car I have seen the groscope principle, for balancing such a car, dis-cussed numerous times, but there is one point regard ing gyroscopes which I have never seen mentioned in connection with this achieva.

connection with this scheme.

It may not be of much importance, but it is nevertheless interesting, to note that a gyroscope does not retain its balance relative to the earth, but relative to a fixed point in space In other words, it would appear that on a "mono-railroad" running north and th a car would be tilted to the west at the rate of fifteen degrees per hour, or one degree every four minutes, due to the rotation of the earth Of course, this is not fast enough to inconvenience

anything, and perhaps Mr Brennan has provided a way to overcome this difficulty, but if not, it would be interesting to hear what others have to say in

At any rate, a solution of this problem would be more interesting and of more practical benefit than the computation of our ancestors For the monorali appears like a great improvement over the double-rail system for economical and rapid transportation In fact, for light, high-speed passenger and express traf-fic, it would seem as if there is a great future in store for the monorali. ### AFRIT IN MINES. To the Editor of the SCIENTIFIC AMERICAN

I noticed in a recent feate of your valuable journal a suggestion for the better safeguarding of the lives of coal miners. As this suggestion was on the line of ideas that I have for some time entertained, I would

like to amend your suggestion by an addition

I believe that stations of refuge, provided with fire
and gas-proof doors, should be established in various and gas-proof doors, anould be established in various places in coal mines, and that these stations be pre-vided with two tubes or casings driven from the su-faces by well-driving machinery. This would allow a sir, food, and water supply to be maintained indef arr, root, and water supply to be maintained indefi-nitely, whether or not it ahould be uccessary to seal the mins for the purpose of extinguishing fires. Of course, it would be necessary to equip each of these stations with telephone and possibly lighting facili-ties, and of course, with facilities for forcing air into

of the pipes ing, without having made figures on

I am assuming, without having made figures on the proposition, that sufficient air to supply a considerable number of mes could be forced through a six-loch table by sufficient pressure.

I believe it should be compulsory that mine operars about porvide some stations which would prevent such appalling calamities as the recent one at Cherry, III, and with this or some similar plan the cost would be so slight that it would be practicable to carry the same into effort. Syracuse, N. Y.

## RESPONDE SEATTS FOR MINES.

TO the Billior of the SCHETTION SKIERS.

To the Billior of the SCHETTION AGENCIAN
As a further safety precaution in the operation of
mines, I vesdie assignet the drilling of large holes, as
many as may be accessary, from the surface to the
main arteries of the workings, up through which, in
cases of dissater such as the recent one at Cherry, III,
men could be farm to safety. Seventeen-inch or
are now quite common in the oil country, and larger
cases could, be delited if necessary. These boles could

be located at different advantageous points, and terminate in rooms in the mines or alcoves cut at the sides of entries in such a location as to not interfere with their daily use Slings made of chains four chains, 30 feet long, spaced equally around a circle the size of the hole, and attached to an iron ring or spider at their upper ends, five small circular plat-forms of strong wire mesh, spaced six feet apart, in side these chains, would make what could be termed a five-storied elevator cage that would haul five m

a Breedroid elevator cage that would haul fav men or len hows up at a trip.

Such a cage could be galvanized for durability, Such a cage could be galvanized for lounds. There could be handholds placed under each platform for the men to grasp to steady Chemselves. These cages would collapse when they would arifte the bottom and could be quickly louded, a man stepping on the cages would be considered to the cage to the to each platform as it would be slowly raised, and sded, could be quickly hoisted to the surface A perhaps better cage could be made of strong wire mesh, platforms and all but would have to be made to descend into a sump drilled deeper jhan the bot-tom of the mine, so that it could be loaded as it was

The holsting frum on the surface could be operated by steam, air, scientice, or seen home power free hater would have been invaluable at Cherry. Ill., as there would have been ample time for seven a slow-operating apparatus to have saved all able to get to it, but an electrically-frien soluter would be prefetable to any other Wires from the power house could be run to each hoister, and proper laspection would insure the apparatus to be in working order, if it should be needed. The holsting drum on the surface could be operated should be needed

Air could be blown down these holes for the supply of the men at the bottom, even if the cages were being used, the wire mesh construction of them allowing its passage. Water, food, oil for light, etc., could be sent down through the holes, and even doctors with medi-

The holes could be left open at all times for venti-lation, but if such would interfere with the working of the fan currents and other ventilation systems of of the size trains and other ventration systems mines, the holes could be kept closed at the top by a proper batten If water from the salls would drip down and interfere with the working of mines, the holes could be plugged at the bottom by means of an oll well packer or similar device which, while porfectly water tight, can be quickly removed, leaving the hole clear

I can see no reason why this plan of rescue in ca of mine disasters would not be entirely practicable and effective, even in mines of one thousand or more feet in depth.

### The Current Supplement,

An illustrated description of the large double-deck An illustrated description of the large double-description by the bearing with has been constructed over the River Wear to accommodate both railroad and highroad traffic is published in the current Surpusaver, No. 1716 "A Log Box and How to Make it" is the title of an article which will undoubtedly be read with interest by amateur mechanics. Up to a few years are water noware ware seattle buself for a son. Now. ago water powers were easily bought for a song Now adays they have so definite a value that the matter of ascertaining their actual horse-power is of considerof sacertaining their actual horse-power in of considerable importance Mr W T Hyan explains how the calculation is made Robert M Strong's excellent comparison of gancine and actools engines in continued. The comet families of Saturn Uranus and Neptune are discussed by H C Wilson. L H Backeland describes the use of his newly invented substance basis for the continued and control purposes. The kinetic scope has entered a new field it now above as mortriag pictures of a world which is fortishle to the naked with the control of the current Source, and the which is explained in the current Source, account of the current Source, and the sential control of the current Source, and the Settlement of the current Source, and the Settlement of the Sett Scott writes on microscopic tree funct. The efficiency of modern aeroplanes is discussed by G Garnier on the basis of the results obtained at Rheims

### A Correction

In an article on page 462 of the Scientific American
T December 18th, 1909 it is stated that by the interposition of a turbine between the low-pressure cylinders and the condenser of the cross-compound recipi cating engines in the 59th Street power station an ad-ditional 8,000 horse-power was secured. The item should have read an additional 8,000 kilowatts. The mouto have read an additional 8,000 kilowatta. The maximum economical output of these engines is now 8,000 kilowata developed in the reciprocating element and an additional 8,000 kilowatts in the turbus mak-ing steal of 1,000 kilowatts or say about 22,000 horse-power for the whole engine

The Municipal Art Commission of New York has just published a catalogue of the works of art belonging to the city of New York It is a book of 240 pages, and contains more than 100 illustrations reproducing the works of art scattered around the city

### THE REAVERS IN JANUARY

B we watch the brighter stars on a clear winters night we may well be impressed with the notable differences in color among them What may strike us first is that a very bright star like Strina when low on the horison visibly hanges color from moment to moment This is like its

tvinking jursty an effect of our simosphere whose retraction changing signity as masses of air of different continuations of the different continuation of t

But when the stars have risen high and the night is clear and calm so that these disturbances are no longer perceptible the differences of color persist Sirius is brilliantly white and so are most of the stars of Orion Capella (whose light much resembles that of our sun) is clearly yellow Aldebaran is orange red and Betelgeux redder still. The fainter stars whose light is too weak to show much color to

the naked eye when ex show similar differences in

nomena so easily observ able must be sought in the stars themselves Re cont i bysi al research has that we may find it in tleir temperature

If we take a solid body such as the carbon file ment of an incandescent lamp and heat it up grad ually to higher and higher temperatures which in this case we may easily do by increasing the elec-tric current—we will ob serve that when it first be-comes visible its light is of a dull red. As the cur rent is increased the light becomes very much brighter and yellow in stead of red

If finally we apply a very high voltage and put through the lamp a heavy current whi h it can stand only a slot time withou only a slot time without breaking down it will give for the moment an intense white light far whiter as well as far brighter than under ordi nary conditions

All in andescent solids er liquids behave in the asme way and careful work both in the labora tory and on theoretial lines has led to a formula (too compil ated to be given here) which enables us to tell just h w much light of any given color (or wave length) will be

(or way lockin) will be given off per square into hof auriace at a given tem perature. We annot of course experiment with tem peratures as bigh as those that prevail upon the sun but there are good reasons to suppose that the formula flus the facts very losely even in this case.

We may illustrate its results by an example sider a star of the same temperature as the sun and suppose that we observe it. (1) through deep red glass whi is transmits only the extreme red rays (2) through the properties of the extreme red rays (3) through a yellow glass transmitting only the pellow and green light (3) by photography when the violet rays are all me effective. Now suppose its temperature meddanly doubled. Our formula tails us that through th red glass it vill look about seven times as bright as before through the yellow glass more than ten times and by photography some twenty times as

If on the other hand its temperature was reduced to half its initial value its light would fall

to balf its initial value its light would fall of much more rapidly the red to 1/46 the reliew to 1/100 and the blue to but 1/400 of its original amount 5 suppose now that we had invest eater close together in the sity whose surfaces were at the three temperatures just discussed Which of them will look bright cet to us will depend on how big they are and how far away. Let us imposes that, whered through the

yellow giass, they all seem equal in brightness, in which case the hottest case must of course be much analier or much more remote, than the coldest. From the aussiers just given we can deduce that, been seen through the red giase the hottest risk was ment to per cent as bright as the cone which resemble the sum and the coldest risk rivier as bright seem but 70 per cent as bright as the convenient of the photography of the contract of the photography the dispersary of the comparison. On the photograph the dispersary was bright and the cold star only one quarter as bright as the one of the solar type We have thus a means of determining their tempera-

We have thus a means of determining their tempera-

We have thus a means of determining their temperatures even though we do not know how far off they are nor what is their sectual brightness by comparing other relative hypitoness in light of different colors An extensive series of observations of this sort have recently been made all Potadem by Scheiber and Wilhing using appearatus of high precision and great care to avoid all sources of ever and employing five care to avoid all sources of ever and employing the different colors of light so that the comparis values obtained from them might serve as a check not only upon the accuracy of the observations
of the formula used in calculation

The results are highly satisfactory and form an im-ortant contribution to our knowledge of the stars. As is obviously to be expected from what has been

cone. In the expellence, Eligh my almost everybode, in Therem, marked by the group of the Philopies and the red Alfolderam, Bollow is the splendid Grice, and is-ments him Castle Rajac with the incomparable first-ine. ### THE RESPONSIONAL STREET, OF TAXABLE

ent state of science, the solution of the m of vision at a distance by means of electrical mission appears to be only a question of money rehes in this field are directed toward the utiliza-Researches in this field are directed toward the utiliza-tion of a possifar property of the element selentum, which conducts electricity more or less readily in pro-portion to the intensity of the light which falls upon it Upon this property is based the system of electrical Upon this property is nessed the system of sectrical transmission of photographs which was invented by Prof. Korn, of Munich, and which has for several months been in regular operation between the offices of the Dally Mirror in London and L Illustration in Paris The general arrangement of Korn s appare has already been described

in the Scientist Assess CAN The photograph to be transmitted a negative film, is wrapped round a cylinder which is caused to rotate before a source to rotate before a source of light to arranged that only a very small area of the photograph is illuminated at a time. The pen cil of light after traversing the film falls upon a coll of selection formation of the coll of selection of selection of the coll of selection o

Owing to the property of selenium mentioned above the cur reat which flows through this selenium cell at any reat which now a trough its seienting out at any instant is proportional to the transparency of the negative film at the point traversed by the pentil of light at that instant at the receiving station this flutus ating current is employed to uncover to an extent proportional to the instantaneous strength of the cur proportional to the instantaneous strength of the cur rent a lass which couvers a beam of light upon a photographic film carried by a cylinder which relates in synchronism with the cylinder at the transmitting station. Hence the part of the film on which the beam falls is illuminated and consequently blackaned to a degree proportional to the transparency of the corresponding part of the original film. In short a negative at one station produce a positive pletter at the other by the successive transmission of many the other by the successive transamall parts

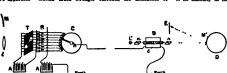

Instead of prolonging the operation in this m Instead of prolonging the operation in this manner that suppose that its sall done at once. Let us project the image upon a sheat of selenium divided into a very large number of small colle each of which is connected with the receiving station by a separate wire it is evident that in this way the entire piture could be transmitted at once and consequently that electrical vision at a distance could be resulted. Fat in order to accomplish this thousands of wires each connected with appropriate apparatus, would be required and the suppose incurred would probably be out of all proportion to the value of the passults obout of all proportion to the value of the results ob

This theoretical scheme has not formed the basis of any practical experiments which have yet been brought to public notice. It was announced a few menths ago that E Ruhmer the well known electri-cian of Berlin had solved the problem and that his apparatus costing an enormous sum to construct would be the principal attraction at the Exposition at Brussels in 1910 No details of the apparatus how ever have been published. We know that it employs enium but we do not know whether it uses one

satestime but we do not know whether it uses one wire or many wires.

In Ma state of the problem it seems particularly interesting to note the solution proposed by two French inventors. M Rignoux and Prof Fournier some of whose experiments the writer has had the good fortune to winess.

Rignoux and Fornier have invented two types of apparatus. The first is designed mersiy for demon stration and necessitates the employment of many wires it may be described briefly as follows at the transmitting station on object (a large letter of the alphabet for example) is strongly illuminated and its image is projected by a lens upon a rema-containing a number of selentum cells each of which is connected with the receiving station by a separate containing a number of scientius cells each of which is connected with the receiving station by a separate wire Bisch cell, and its wire, transmits a current proportional to the hrightness of the part of the in age projected on that cell and the corresponding part of the object At the receiving station these simulta-neous currents of unequal intensity travers an equal number of little cells, and thereby uncover the same number of little mirrors to an extent proportional of the strengths of the surface currents Beams of light the strengths of the various currents Beams of light redecide by these infrores are protected on a case, side by side, forming maches of various degrees of trightness, proportional to test of the corresponding parts of the object. With a 'buy' sarps number of sidentess solits, wires, coils, and univers it would be possible to trademic is picture with fine detail and plany gradations of trans. The experimental deman-plation, valued in acquairy made in summary and crude, but quite convincing. The multiplicity of wires is a serious defect, which the inventors believe they have found means of remedying in their second apperatus which is in course of construction and is illus-trated by the accompanying diagram. At the transmitting station the rays of the luminous source L are reflected by the mirror M upon the object O the image of which is projected by the lens I upon the frame of selenium cells T (The diagram shows a frame of eight cells and an object divided into eight equal Two of the squares are white and their ages illuminate the two corresponding selesium cells.)
The very weak currents transmitted by the selesium cells are sent into the relay R where they set into motion much stronger currents, the intensities of

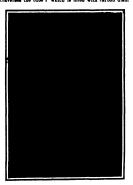

THE RIGHOUX POURNIER SYSTEM OF TELEVISION

which are proportional to those of the scientium call currents to the illumination of the respective cells d to the brightness of the corresponding parts of the

object. The problem is to transmit all of these currents through a single wire without confusion and to receive them and cause them to act separately and simultaneously at the receiving station. For this purpose Rignoux and Fournier have devised the fol lowing arrangement. The currents are convoyed to the contact pieces of the collector C from which they are taken successively by a rapidly rotating wheel which is connected with the receiving station by a

Let us for the moment disregard the question of poed of transmission and consider the means by

speed of transmission and consider the means of which these successive currents are received. At the receiving station the light of a source L polarized by its passage through the Nicol prism a traverses the tube f which is filled with carbon disul

phide, and then falls upon a se which is crossed with regard to the first prism which is crossed with regard to the first prism the tube is surrounded by a coll of wire B which is connected with the wire coming from the transmitting station. Hence the currents which traverse the selen ium cells for the transmitter flow successively through ism calls for the transmitter flow successively through this cell and profuse an electromagnetic rotation of the plane of polarisation of the light which is passeng through the earbon distubble to a digree proportional to the illumination of the particular selection cell which is momentarily connected with the line wire causing corresponding fluctuations in the intensity of the light which energies from the second Nijodi primes of This beam of light of varying its couldn't falls upon the cylinder D which rotates in synchronism with the collector  $\mathcal O$  at the transmitting station, and which carries a number of mirrors M', equal to the number of selection cells Hence each mirror redects a quantity of light proportional to the illumination of a particular selection cell and the brightness of the corresponding part of the object. The mirrors are so arranged that the light reflected by each falls on a different part of the streen E on which is thus produced a mosak picture formed of patches of various degrees of brightness of the object exposed at the transmitting station

It is possible to transmit and make visib! in this manner employing a single wire an image produced by several thousands of selenium cells? Yes There is no difficulty in constructing a frame of 100

more scientum cells each connected by a separate wire with a collector which emprises an equal ly large numb r of con tacts Now if we remem alternation of an alternat ing current often exceeds 100 000 cycles per second it becomes evident that 10 000 currents can be col lected and transmitted successively over a single wire in a small fraction of

a second By the employment of 10 000 mirrors at r ceiving station an image composed of 10 000 patches of light can be projected within the same fraction of a second The different parts of the picture will a slly be projected successively but they will appear to be simultaneous owing to the punistence of im pressions on the retina of the eye if the projection of the entire picture is accomplished within 1/40 second and the apparatus can be so constructed that this process will be repeated indefinitely giving the appear ance of a persistent picture instead of a feeting

Hitherto we have supposed the number of mirrors to be equal to the number of selenium cells. It may be found possible however to diminish the number of mirrors and to operate each mirror successively by of mirrors and to operate : ach mirror successively by the currents from several (cils. This modification could doubtless involve complications and difficulties in construction which we need not discuss. For the present if suffices to show that the problem of vision at a distance by means of a single wire connecting the two stations has been solved by MM Rignous and Pournier in the practical realization of the de-and Pournier in the practical realization of the degired result the inventors will have to reckon with the phenomena of self induction interfere electric inertia of selenium but these are familiar technical difficulties which will sooner or later be sur

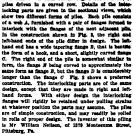

### DAVID STARR JORDAN

The distinction of studying natural history under Louis Agnasis in the laboratories in Cambridge is one to be highly appreciated and of the many ciminent naturalists who were so fortunate as to re-crite their first impiration under the guidance of that renowned measure many if not most have ceased their artivities. Of the saritar students Brooks Hyatt and Packard have joined the silent Brooks Hyst! and Psckard have joined the silent majority Alexander Agassis Pultans Scodder and Verrill are fortunately still with us in the happy non session of an assured fame. At the close of the clder Agassis a career he established a numner school on Penfices island and of those who studied there two have achieved especial distinction. But hard Rathban the Agastant Sierekay of the Smithsonian Institu the Assistant Bevretary of the Smithsonian matter tion who is now directing the activities of a score or more of vouncer men in the work of the National Museum and David Starr Iordan who presides over the destinies of the great Stanford Indiversity in Call fornia Prof Jordan has ben called to presid over the meeting of the American Association to be held this week in Boston and of him is the following brief

David Starr Jordan was born in Gainesville New York on January 19th 1851 and grew up on his fathers farm in Wyoming County receiving his early fathers farm in Wyoming County rectiving his early columnts in achools in the vitality of his home in 1888 he entered Cornell and there devoted himself to be coleculated under devotoping a special interest in bot any in which branch he was made instructor in his pulsor years and continued to hold that place until he has been continued to hold that place until he has a called to the chair of natural history of Combard Indivestity in 1872. A nince which he held

He was called to the chair of natural history in Lombard University in 1872 a place which he beld for a year and then accepted the principalship of the Appleton (Wis) Collegiate Institute. He then entered the Anderson School on Penfices Island as a student and lectured there on marine botany during the sum mer of 1874. It was there that he came under the influence of the elder Agassiv and began his studies (Continued on sage 18.)

A north form of gas-main stopper is likewised in the norman-part of gas-main stopper is likewised in the scenimary of the sce at B Connecting opposite extremities of the oval shaped spring frame A are a pair of telescoping mem bers C, to which the operating handles D and E are attached. It will be evident that when the handle # is drawn upward and handle D pressed downward, the member O will telescope, drawing the frame A into cir-cular form. In order to provide for operating both of cular form: In order to provide for operating both of the handle here simultaneously, a croushand F is fitted to the outer end of the her D, and is provided with an aperture through which a threaded her G is adapted to pass. The her G terminates in a hook, which sa-gares a lith secured to the her Z, and a thumb not ages as this secured to the her Z, and a thumb not hand P serves to draw the her Z outward, and at the same time to present hele PI haven's, on at to present the stopper into the circular form. In use the stopper into the circular form: In use the stopper, and introduced into the gas main through an opening. introduced into the gas main through an opening, and inclined with its lower end extending toward the end inclined with its lower and extending toward the and from which the gas is flowing. The operating bars project through the opening, and when the thumb nut is tightened the frame is brought to a nearly vertical position, as indicated in the drawing, thus Jying crosswise of the main and effectually stopping the flow of gas. The inventor of this improved gas-main stopper is Mr Patrick Goodman of 257 East 183rd Street, New York city

A HOVEL METHOD OF COOPERING CAMES, It is outsomary to build casks with tapering sides, so that the hoops which bind the staves together may be jammed tightly in place. This makes it necessary to shape the staves, which entails considerable waste or material and much rouble in assembling and benefits the therefore the control of material and much trouble in assembling and bend-

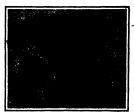

of metal that is crimited or bent into a signage form. This lightmean the construction, and pro-vides a better grip on the hoops and stave. In many trades small keps and catave. In the many trades small keps and catave of moderate size for liquids are required, but their high price and the cent of machinery for making them is prohibitive for many purposes. The casks here described are separately satisfied to meet the requirements of such trades, because after the staves and heads are prepared they can be finished inside and out (Including only ting the growthm) in an ordinary inthe, produc-ing an inergensive cask of attractive and fin-ished appearance. The invastor of this more construction is Mr. William Houlker of Neilson, New Sepaind.

lined is then filled with the iron balls, which are find on the under side to prevent them from rolling. The magnetized plats converts the balls into temporary magnets, causing them to cling to the plate and to magnets, causing them to cling to the plate and to cash other. After the area of the drawing is filled, cash other. After the area of the drawing is filled, frame, as indicated in the segretne, and the number of square inches occupied by the fails is secondaried. Tables are turnished which permit or reducing the square inches thus found to the scale of the drawing, thus giving the area sought without any solutiation. It will be observed that the side members of the meas-

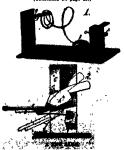

AREA-FINRING APPARATUR.

uring frame are calibrated, and the aliding cross-bar is provided with vernier scales, so that the area occu-pied by the balls may be obtained with exactitude. se with which any given area can be set on first The ease with which any given area can or set on area trial should make this apparatus valuable to engineers and surveyors. The apparatus is adaptable to irrequal to a well as regular surfaces. The inventor of the area finder is Mr Alfred C Freeman of Norfolk, Va.

### A MRW GAME.

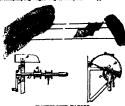

Pictured in the accompanying engraving is a novel game apparatus, which is adapted to afford consider-able recreation, as it calls for a certain amount of skill. (Concluded On page 28.)

CLOTHER-LINE HANGER.

The clothes-line hanger which is illustrated in the accompanying engraving is adapted to support a num-

CLOTHES-LINE HANGER

ber of clothes lines at the same time, and yet permits of taking up the stack of the lines individually or alto-gather when desired. The lines are attached at one end to a fixed support, while the other ends are con-nected to separate rocks, all of which are mounted on a single shaft that may be wound up to stretch the lines taut. The shaft, which is indicated at A, is prolines taut. The same, where is indicated at A, B) provided at intervals with square sections adapted to fit the square borus of the reels B. The shaft is mounted in suitable brackets attached to a wall, and at each end is provided with a ratchet and a crank, so that it may be wound up to tighten the lines. Each line is provided with a hook at one end adapted to engage a

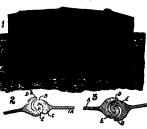

A HOVEL METHOD OF COOPERING CASES.

corresponding eye in the bar E, which is made fast to an opposite wall or other support. Whenever it is de-sired to take in one of the lines, or to tighten it or loosen it with respect to the others, the reel on which it is wound is moved axially until it clears the squared section of the shaft A, and is then free to be turned in either direction. Whenever desired, the bar Z may be released from its support and the lines wound up A cover piece D may then be dropped over the reels to protect them from the weather A patent on this cother-line hanger has been obtained by Mr George T. Van Riper, 152 South Ocean Avenue, Freeport, N Y

A well-known ash-lets, Mr. Holding, run a unposed qua-ter of a mile in fitty seconds after breathing oxygen for three minutes; is the trial for the Clympian games he had been unable to do this in less than fiftytwo seconds. It seems he was not more distressed than if he had run one hus dred yards; there was, it was reg a notable absence of that stiffness muscles and grogginess in the lege which muscles and grougeness in the lags which follow great exertion in running. An-other athlete, Mr Just, after breathing oxygen for three minutes, ran half a mile in one minute and fifty-five seconds, slightly beating his record. lightly beating his record.
I confess I am not much impr

these achievements. I think, on the con-trary, the preliminaries to them were trary, the preliminatives to them were reprehensible. Oxygen in a stimulant, and it is for its stimulant properties that Dr. Hill advocates its use in athleton. This is especially bad for young men, who are generally our athletes. You should need attituition. Wooderve, moreover, the oxygen is given before a more bittle oxygen in the contract of the c Human energy is thus increased, but the increase is abi increase is abnormal, as is also the ex-ponditure of energy. Nor are the se-quelss without disaster Do not our ath-lette young men, as it is, grow into ma-turity with bad enough hearts? Every doctor must give melanchely testimony that such is the case But here we are that such is the case But here we are advised to attituate unnaturally a heart already functioning to its limit. And it is unphysiological to give any stimulant before a feat of strength or a trial of oderance, capabilities are than perversaly and unnaturally oversrought. All stimulants—orgam, whistly, coss, and the like—should be given not before, but after, a race, a journey, or a mountain climb, and the property of the person of the contraction of the person of the perso

economy to par arror the unaue exertion. Here is a matter which seems to me not altogether trivial. Besides, this "doping" of contestants before a rose is unsportsmanliks. Tests of physical brawn and endurance are legitimate only when they are made un-der normal conditions—those in which human life must ordinarily be lived. The true sportsman will countenance athlet ics only when the contestant depends for ics only when the contestant depends for success upon no other factors than his better physique and superior skill. Oxy-gen stimulation would possibly make an untrained, undeveloped, short-winded, untrained, undervaloped, short-winded, soft-munical specimes successful for the brief span of a given contest; but for all that he would be the poorer and not the better man. It may be recalled that some years ago a birtylist 'made' a mile in less than a minute, behind a rathus print print grid that rate; a month bester out the search of the search and the search He was thus protected from the winds, especially headwinds, and was moreover assisted by the suction exerted by the fast-moving train. Genuine sportsmen rightly held his record to be valueless; for it was achieved under unnatural con-ditions, not under such as must be chanced and grappled with in nature.

til 1879, when he was chosen to fill a
similar chair in the University of Indi-ans, in the possession of which he con-tinued until 1885, when he became presi-

dent of that university
In 1885 Leland Stanford, who served the State of California as its Governor and as its representative in the United States Senate, founded in memory of his son the Leland Stanford Junior University, having as its object to "qual ify students for personal success and diiry students for personal success and di rect usefulness in life." This university with the richest foundation of any simi lar institution in the United States a that time, was formally opened on Orto-ber 1st, 1891, with Dr Jordan as its por ist, 1891, with Dr Jordan as its president. Since that time be has con tinued to fill that important office, ful silling with rare skill and unusual ability the will of its founder, who publicly said that "a generous education is the birth right of every man and woman in America".

Dr Jordan's great knowledge of fishes Dr. Jordan's great knowledge of fishes was early taken advantage of by the U S Bureau of Fisheries, and from 1877 until he went to Stanford University he served as assistant to the U S Fish Commission, as it was then called During 1886-80, as it was a U S commissioner in charge of the sessing investigations, and in 1984 when the commissioner of the session of the session should be certain investigations, and in 1984 when the commission of the session o ernment. In connection with his offi searches he has made many trips on the Pacific, frequently visiting Alaska, Hawaii, and far-away Japan, making lawaii, and in-away sapan, maning large collections, selections from which, especially types of new forms, have been deposited in the II S National Museum Of the publications of this institution, he prepared as "Contributions to North American Ichthyology," three bulletins American ichthyology," three bulletins cuttilde respectively I "Review of Rafnesque's Memoirs on North American Flahes" (1877), II A "Note on Cottide, 
Etheostomide, Pertide, Centrarchide, 
Aphododeride, Dorysomatides, and Cyprinide, with revisions of the genera and descriptions of new or little known spe descriptions of new or little known spe-cies" B "Bynopsis of the Silurida or the freah waters of North America" (1877), and III A "On the distribution of the flabes of the Allephany region of South Carolina, Georgia, and Tenaesee, with descriptions of new or little known spe-cies" B "A Synopsis of the family Ca-touriomide" (1878)

tionsommer (1878)

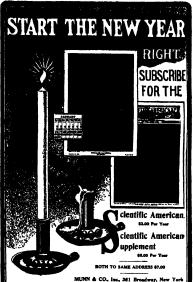

He has further enriched the many volumos of the Proceedings of the U S National Museum with accounts of his discovertes, which have gained for him the
reputation of being the foremost author ity on the sea fauna of the Pacific By far however, his greatest contribution to the Smithsonian publications is the well the Smithsonian publications is the pre-known Bulletin No 47, which he prepared in co-operation with Barton pared in co-peration with Barton W Everman II bears the title of "The Flahes of North and Middle America." And is essentially a dost ripitor catalogue of the species of fish like vertebrates found in the waters of North America, north of the Isthmuss of Panama. In it are described 255 families, 1,438 genera are described 255 families, 1,438 genera and 8,248 species and 6,248 species and of covering a 2,138 perior size to the con-ception of the species of the con-traction of the contraction of the con-ception of the contraction of the con-traction of the contraction of the contraction of the conspecies It forms four octavo volumes covering 3.315 pages with 329 plates, in which nearly 1,000 fishes are illustrated Dr Jordan is also the author of "A Manual of Vortebrate Asimals of Northern United States", "Animal Life", "Animal Furns", "Food and Game Flakes of North America", and "A Guide the Carte of Flakes" (Sevent of these the Carte of Flakes"). to the Study of Fishes." Several of these works were written in association with his scientific colleagues of the Bureau of Fishes and Stanford University.

Fishes and Stanford University.

His more popular contributions to literature include the following works in book form: "Science Sketches", "Foot notes to Evolution", 'Care and Culture of Men", "This Innumerable Company", "Importal Democracy", "The Philosophy Tologo of the Scholar", "The Cull of the Twestisth Century The Could of the Twestisth Century The Could of the Twestisth Century The Could of the Twestisth Century The Country of Concluded on page 12.)

MUNN & COMPANY, Inc., 361 Broadway, NEW YORK

(Concluded from page 17) entitled "To Barbara." M verse entitled "To Barbara," Many these books are collections of his lect and addresses before popular audiences for Dr Jordan has always been in de

mand as a speaker from the lecture plat-Many honors have come to him degree of MD was conferred on him by the Indiana Medical College in 1875, that of Ph.D was given him by Butler Uni-versity in 1878, while that of LL D was versity in 1878, while that of LL D was contered on him by his aims mater 1886, and by the Johns Hopkins Univer sity in 1902. He is a member of many scientific societies, including the Ameri-

necession societies, including the American Philosophical Society, and during 1896-8 he was president of the California Academy of Sciences Besides the foregoing he is a vice president of the Carne gie Foundation for the Advancement of

Touching.

vancement of Science enrolled his name among its members at its second Montreal meeting in 1882, and a year later he was advanced to the grade of Fellow The section on Biology made him its vicepresident for the year 1895, but absence rom the country prevented him from ac cepting the office on that occasion Ac-cordingly in 1900 he was again chosen, and presided over the section at the Denor meeting, delivering a retring aggress on "The Fish Fauna of Japan with Ob-servations on the Geographical Distribu-tion of Fishes" At the meeting held in Baltimore a year ago this time Di Joi dan was the unanimous choice of his sel entific associates for the highest office in the gift of the Association, and will take the chair at the Boston meeting

### A WEW GAME

(Concluded from page 1))

It consists in general of a peg pro-vided with a set of recesses which are numbered 5 10 15, etc and a projetting device adapted to throw a ring on this peg, so that it will hang from any one of these recesses. The project-ing device casts the ring in such a way that it turns a complete somersault in transit, which adds to the difficulty of making the ring full in the recess bear making the ting fail in the recess war-ing the highest number. The projecting device is shown in detail in cross-sev-tional view. It consists of a lever 4 provided at its lower and with a flat plate B adapted to receive the projectile. The lever 4 is mounted between a pair of uprights C and a spring D presses lever upward against a stop piece ring B is placed on the plate B and then dotted lines, and on being suddenly ic dotted lines, and on being suddenly is leased throws the ling to the lieg F. The lecesses above referred to ale indicated at G. It will be evident that consider-able skill is required to gage the exact height to which the harr 4 must be lifted, so that when released it will throw the ring to the desired racess andst in operating the projector the top crosspiece of the frame C projects at each crosspice of the trains C projects at each side, and provides a rest for the high side while the thumb is engaging the end of the lever A. The inventor of this game is Mr. Pierre V. Ericson, Cherokee Avenue, Hollis, Long Is'and N. Y.

In a recent number of the Zeitschrift Phys. Chem. T Syedberg describes some experiments on the limit of visibility of color produced by various substances in dilute solutions passing from coppor sul-phate in fuchsine and colloidal gold. It is shown that in the case of colloidal par-ticles the absorptive power is at first almost independent of the size, but pro-portional to the number, of the particles On reducing the size of the particles, how ever, their absorptive power becomes is and finally the ordinary condition of a transparent (true) solution is attained Syedborg argues that his experiments demonstrate the continuity of the colloid-al and crystalloid states, and therefore the corporeal existence of molecules

# Which Will You Choose?

Will it be "Just a Common Job" at small pay or one of the well-paid positions which the American School of Corondence can train you to

### A REW PRA OF THE STRAW REGINE

F in the days of the perfected quadruple-expansion steam engine, anyone had ventured to criticise the type as being very inefficient as a means of extracting the heat energy of the steam that passed through it, he would have been considered as pleased through it, he would have been considered as hypercritical, to say the least And if he had wes-tured to predict that within a few years, by interpos-ing a certain device between the low-pressure cylin-der and the condenser, it would become possible to show an increased economy of from 25 to 35 per cent, and, in some cases, to increase the total horse-power output of an engine by from 70 to 100 per cent, he would have been regarded as a visionary. Yet it is a fact that this doubling of the capacity of an engine bas actually been accomplished, as stated in our editornal of December 18th, 1909, describing the remarkable

of December 18th, 1993, describing the remarkable work being done at the Pifty intil Street power station of the New York subray system. It is no exaggraction to state that the low pressure turbine has introduced an era of improvement in stemmengine practice which is destined to mark an advance in the art, greater than any recorded during mover, and we say this with full appreciation of the past estuarty of the history of this great point mover, and we say this with full appreciation of the control of the pressure conducting and the prounding and the later multiple-crystands neighbor continuing the pressure conducting engines of the time of Robert Pation, bollers were so weak and steam pressures so low that the cond-near was an absolutely

ares so low that the condenser was an absolutely sary accessory When Iron and steel plates benecessary accessory. When from and steel plates became available for boiler manufacture, there was a sponding rise in steam pressure, which led to a gradual abandonment of the condenser and a tendency to obtain the desired horse-power by working on the higher ranges of pressure. The high-pressure engine higher ranges of pressure. The high-pressure engine exhausting directly to the atmosphere was, of coirse, an extremely wasteful device, and the invention of the compound engine was logical and inevitable. Then followed the triple and quadruple engines, the limit of expansion being reached when the low-pressure cylinder became too large for practical purposes. If a cylinder were built that would carry the expansion of the stoam down to the full theoretical limit of reciprocal-lang-agine efficiency, its dimensions would be exag-gerated out of all proportion to the rest of the engine; the weight would be snormous, and the losses through frittion, and because of the great radiating surface. would be probibitive.

The steam turbine, on the other hand, is particu The steam turbine, on the other hand, is particularly adapted for accommodating the great expansion of the steam in the lower ranges of pressure, just as the reciprocating engine is better suited for developing the expansion in the higher ranges. The turbine losses in the higher ranges are largely due to the fric-tion of the rapidly revolving blades in the steam at its relatively high density whon under high pressure, whereas skin friction is not a serious factor during the expansion of steam in a high-pressure critical the latest pressure of the serious factor during the expansion of steam in a high-pressure critical factor to the serious factor and the serious factor and factor to the serious factor and factor to the serious factor and factor facto the lower pressures the steam has a small density, and the skin friction losses are incomiderable. Again, the great drop in temporature in a low-pressure cylin-der induces rapid condensation, and greatly reduces

the efficiency Hence, it will be seen that the reciprocating engine working on the higher ranges of pressure and the turbine working on the lower ranges are the comple-ments, the one of the other, and when acting in our

ments, the one of the other, and when acting in com-binating torm an ideally economical arrangement.

The range of application of the new system is wide, and alimsely the turbine is winning back for machi-ver's the approximate amount of heat which wide fortherly lost in the reversing rolling online at the steel works.

### BAPID TRANSIT BY BRIT CONVEYER.

BY the action of the Board of Estimate of this city, which, on December 3rd last, passed a resolution authorising the Public Service Commission to lay out a morning platform subway in Thirty-fourth Street between Second and Ninth Avenue, there will be given an opportunity to test a system of transportation which we have always considered to be ideally adapted for relieving the crowded traffic conditions in congested centers of large

By far the most efficient means of moving n in bulk is the belt conveyer. For transp terial that is in a more or less finely divided nonei-tion, or made up of a large number of small separate tion, or mane up or a large number at small separate units, such material, for liestance, as grain, coal, or fron ere, the belt conveyor is recognized in the in-dustrial world as having no equal—provided, of course, that the distance to which the material is to be carried and the speed are not excessive

The moving platform is practically a continuous boil conveyer for the conveyance of a large number of passengars at moderate speed. It consists of abort lengths of platform, coupled together, forming an end-lengths of platform, coupled together, forming an end-length of platform, coupled together, forming an end-length of the platform of the platfo parallel rows of platform, the first adjoining the sta-tion platform, moving at three miles an hour, the next at six miles, the third at nine miles, while the fourth, which will be entirely covered from end to end with seats, will move continuously at twelve niles an bour Entrances to the moving-platform submilles an bour ranners to the moving-paratorn sur-way will be placed at every intersecting avenue or street, as the case may be The capacity will be 73,500 seated passengers per hour in one direction during the rush hour, as against 13,000 seated passengers on the eightear express train service and 7,500 on the five-

evanicar current service and injust on the mass against 25,000 standing and seated passengers per hour on the express service and 22,000 on the local services in a recent communication to the Public Berrice Commission by its chief engineer, Henry B Seeman, the advantages of the new system are stated to be. First, a vasily increased capacity and seats for all passengers, second, absence of the delay incurred by waiting for trains at stations since the train is always there and constantly moving third, the fact that pas sengers may board or leave the train at any point at will, and that instead of plating stations one-third of a mile spart, as on the present subway, they may be placed at every cross street, or indeed at any inter-mediate point. Furthermore, the subway construction may take the form of a continuous arcade, thus pro-viding an additional business front for display aid shouping purposes.

Although the moving platform speed of twelve m Although the moving platform speed of twelve mikes per hour may seem nomewhat show as combassed with the running speed of a subway truin, the difference is not nearly so great as might be supposed, and, indeed, over the shorter distances, is entirely in favor of the new system. The Commission's segimen shad itself for all distances of less than four miles the moving platform is a quicker and move convenient mode of platters is a quiteer and more convenient more or conveyance than the local trail service, or even quick-er than the local and express service combined, as passenger reaching Times Square Battots, From second Street, from any local station south of Fourteeth Street quicker by the moving platform than by the local and express trains of the present subway, The local frains ordinarily average, including atops, about fitted miles per hour, and twelve miles an hour during the rush of traffic If this rush hour service

acoust interes mission profes, and vessers subset as about a contract of the c

rrom es to et million, and the total expenses per tog-mile, even with the intersect on outpital coat of the electric installation reckneed in, have been reduced from 0.344 to 0.383 of a posity. On those branches of the North-Richtern Rallway that have been electrified, the train mileage has been

that have been electrined, the train mineage has eva-doubled, the platform capacity of the shain station at Newcastie has been increased, and the number of signal movements has been reduced by one-bill. These advantages, coupled with the higher rate of acceleration of the electric trains, have enabled these roads to carry, a trains that would have completely swimped

carry a trame tank would have completely swamped. It is of interest to note that in connection with the electrification of a branch of the Middand Railway, tests which are being made of the relative advantages of direct-current and single-phase operation seem to show that not only in the single phase taking care of the same service as the direct current. but that the show that not only is the single phage taking care of the same service as the direct current, but that the weight of the trains is only slightly greater, and the consumption of energy somewhat less. It is to be hoped that our New York Contral and New Hawn, and the alternating current, will make public, for jurposes of comparison upon a compon basis, the re-nalize of the past two years of electric operation. If these figures were given, together with the cost of stem operation of these same sections of road, the electrical world would be humished with a mass of dail of executional values and thisrance.

A new steam-electric locomotive is being built in England II comprises a steam turbles which operates a dyname supplying current for four series wound motors. The engine is being designed to have press trains and will be tested in actual service so as to show its efficiency as compared with the ordinary steam locomotive. It is pointed out that turbo gar entors have proved so efficient in sationary plants that a similar system would very probably prove to be of vision on relatively to replace steam locomotive.

A great number of elements was studied by Madams Carrie but with the exceptions of radium uranium and thorium she found no elementary abustance peased of a radioactivity greater than one one seased of a radioactivity greater than one one seased of a radioactivity greater than one one threater of the radioactivity of the results of a great many substances. Their experiments confirm Campbell is results to regard to the radio activity of potassium and rubidium. This radioactivity however is very small being in the case of potassium only 1/1000 of the activity of the fradiation of uranium ordied. In this case the results of the results of the case of potassium only 1/1000 of the activity of the fradiation of uranium ordied. In this case the results of the results o

## A UNIVERSAL VISE.

BY JACQUES BOYER.

Visce usually occupy fixed positions and serve merely as clamps by which the wood or other material is prevented from moving while the workman is com pelled to adapt the position of his tools and his body to circumstances as best he may The ordinary vise no matter what the purpose for which it is designed consists of two jaws one fixed the other movable. The latter is moved toward and away from the forms

the factor is moved to wat do not not not not not not not not in the fixed law and in a col lar in the movable law and the movem at its opposed by a flat spring which takes up the lost mo-

The universal vise invented by P Glong on is mounted on a ball and socket joint which allows it and the object held by it to be turned in a y dir tion so that the work an be done more conven-iently and in a favorable light iontly and in a lavorage light.
When the vise has been set in the
destr d position the ball and so ket
joint is locked and held motionless
by a do bie joi ed jaw opera ed
by a strai termina ing in a loop in whi b h workman's foot is placed

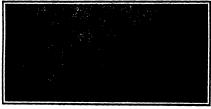

As he accompanying photograph indicates the niversal vise is de signed primarily for the use of shoen akers It can be employed with advantage in shaping sewing nating and aim

e ery other operation involved in the making and re pairing of shoes The shoe and the standard which carries it can be turned into any position and instantly bilized without touching the screw of the vise so that shaping can be done mu h better than is possi ble with a rotating vertical standard as the sole and the heel can be placed in the positions most favorable

The apparat s is very simple and comprises only five large parts and two pins.

The Pacific coast I mber man facturers have taken the initiative in an important step for the promotion of

proper and conservative use of their timber supply Practically all of the large manufacturers of lumber in the States of Oregon and Washington have entered into the States of Oregon and Washington have entered byte an agreement to manufacture odd as well as evan lengths in Scoring Snish and similar planing-mill products. Heretofore it has been customary to mass facture these products in oven lengths only Now it is proposed to trim the manufactured lumber to of odd numbers as well as even numbers of feet sed to trim the manufactured lumber to be

THE UNIVERSAL VIOL

the old system a considerable portion of the lumber which came to the shaping machine was wasted and this action has been taken in order to save that waste this action has been taken in order to mare that wasts Considerable opposition to this innovation has arisen among retailers and consumers. The retailer contends that it is impossible for him to dispose of odd length material because of the common practice in the con-struction of wooden buildings claiming that the initial saving of the manufacturer is transferred to the con sumer This is denied however because of the pro-portionally small amount of odd length material which portionally small amount of odd length material which will occur under the new system and because of the latter day practice of laying sub-floors of rough lumber and sheathing on the sides of the house before putting the finishing material in piace. Becomes of servation element which enters into this que United States Forest Service has been recomthe adoption of odd lengths for some time past. The Portland office of the Service has recently made an investigation of the actual amount of unprecentry waste incident to the manufacture of even jungths only wants incident to the manufacture of even jumpins only and these figures show that under the del system the refuse burner consumed about two per cent of the total amount of the important forms of planing-mill products which are manufactured from Douglas fir and

manuscured from Desgias in and other important forest species in the States of Gregon and Washing-ton When it is countdered that about 750 000 000 feet of planing mill products are manufactured a nually in the two States mentions nually in the two States mentioned above this two per cent assumes important proportions. The Forest Berrice is authority for the statement that 15 000 000 board feet of high-pric 1 unnber can be saved annually o Oregon and Washing ton by the meanifacture of planing-mill products into lengths of odd feet as well as even It would require the yearly growth of timber on approximately 20 000 acres of average timber land to produce the

amount of lumber which this an nual waste represents The manufacturer is convinced that the waste is unnecessary. His greatest trouble now lies with a similar conviction on the part of the consumer that odd lengths can be used as economically na even lengths

The new Mexican Pan American Tailway has already been opened states the American Machinist and the line is in active operation from San Jeronimo as the Tubuantupec Railway to Tapachula in Chiapan. The estimation of that line will be continued to Post San Sentic on the Pacific coast There is also planned a new rallway peasing through parts of the States of Coabulla and Chinahua, about 275 miles long

## MECHANICAL BOWLING MACHINE.

## BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

Numero s efforts have been made from time to time to device a n echanical apparatus for reproducing hu man action in the dolivery of a bail in various games here such is required su h as baseball cricket ten nis and so forth The problem however is somewhat nis and so forth amuch as in bowling success is largely de pendent upon the brains of the bowler who resorts to varying subterfuges to nonplus his opponent such as varying the pace swerve and break of the ball while in the air or after it has struck the ground To repromake arror area it has struct to ground to repro-duce those peculiari tes by mechanical affort is no easy matter but an English engineer Mr D D Fuson MIME of Bir

minghan has perfected an ingeni

As may be seen the apparatus comprises a tripod of steel tubing firmly fixed to the ground by means of specially designed anchors which correspond to the body of the bowler. The ball rests freely in a semistherical cup or hand carried at the outer end of a lever about the length of the human arm with which it corresponds the low r end of this lever being piv oted to the body at the shoul

When the machine is at rest the When the machine is at rest the arm rea aims in a vertical position and the bowling operation is preduced by pressing this arm back ward into a northeattal position with the ball resting in the cupshaped hand. Directly the arm is released it files toward its normal position describing therein a quarter of a circle the ball being propelled through the air with varying velocity as desired toward its objecthe This forward movement of the moving arm is produced by the

action of a strong spiral spring one end of which is attached to the moving lever a short distance above the shoulder while the other end is situated to the body by an adjustable tightening server by means of this serve the momentum imparted to the arm and consequently the velocity of the ball can be regulated nearly by situating the tension of the spiral spring.

10

ent of track and engine contacts, warning devices in eab

pair of track contacts, and at the main signal, two
pairs, situated about 30 meters apart. They are so
connected with the signals as to be lifted when the
signal is closed, thus protruding beyond the rail head
and coming into contact with the sild

ing levers of the locomotive, whereas in the event of the signal being drawn, they are located below the rail head, so as to avoid any contact. In addition to these stationary ped-

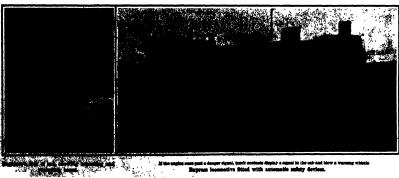

als movable pedals are provided which are readily fitted behind fish plates, with a view to warn and stop trains at any point of the track

The working of the apparatus is as follows On the contact levers passing over the track contacts, the draw bar 10 is pulled down, thus disengaging the click. The ameratus is merely overated by the spiral spring, and as the contact levers perform no work outside of disongaging the tightening apparat-us, any heavy shocks are prevented, and the wear and tear is reduced consider ably

On passing over a distant signal, the contact levers strike only a single pair contact levers arrise only a single pair of podals situated on the track, thus closing an electric circuit, by the action of which the alarm siren is sounded, while a disk bearing the in scription "distant signal" yppears in the cab signal box and a dash is mark ed on the paper tape in the repeating box. The brake cock is opened at the same time and the train is stopped automatically Owing to the automatic disengagement of the brakes, the driver is in a position himself to throw the an paratus out of gear, and to continue

his journey
On a closed main signal being pas over, the contact with the first pair of pedals produces an effect, as above stated, during a very short time which immediately by the second pair of track contacts. In fact, second pair of track contacts in fact, this second contact further disengages the click, thus opening completely the braking cock and producing a rapid braking. At the re-

peating box appears a disk with the inscription "main signal," while at the same signal," while at the same time a dot is marked in the recording box In addition to this, a checking lead is broken. The second contact also causes the apparatus to become locked up, so that the engine driver is no longer in a position himself to throw the apparatus out of gear, be-fore the train guard has re-(Continued on page 3A.)

me past a danger signal, track contests display a signal in the cab and blow a warning whichis Ngayean locomotiva Attad with automatic sufety devices.

## FRICTION

# AT RAILWAY CURVES.

BY J. F. SPRINGER

When two material surfaces are in contact with each other, there are two distinct methods of with drawing points of contact from each other Consider such points to be extremely small plane areas. Thus, let Fig 1 represent a highly magnified sectional view of two contacting points AB represents the infinitesimal plane area (First) The surfaces may be with drawn from each other by moving C or D (or both simultaneously) in a direction perpendicular to the plane represented by AB. This gives rise to what is termed rolling friction (Second) Withdrawal may be effected by moving C or D (or both simultaneously) in any one of the directions lying in the plane rep sented by AB. Thus, the inovement may be along AB. The direction is immaterial, provided it is in the tiny plant of contact. This method of withdrawal gives rise to sliding friction

Now material surfaces are not perfectly smooth When in contact under pressure, the projecting parti-cles interlock with each other—as idealised in Fig 2 it can readily be seen that movement in the directions (1) H would tend to shear off the large projections 1, 2, 3, 4, while movement in the directions B, F would tend to shear off merely the interlocking prot tend to shear off merely the interiorking protuberances of the large projections. That is to say, idling fric-tion involves abrasion of the principal projections, while rolling friction relates merely to projections on projections. Consequently, it is not difficult to com-prehend that aliding and rolling frictions belong to different orders of magnitude. In fact, the one kind of friction is a most important consideration in me-chanical engineering, while the other is usually negli-

It is easily seen that the movement along AH produces what we all understand by sliding friction, but perhaps some may healtate at considering perpendicu lar withdrawal as rolling friction Consider Fig 3 lar withdrawal as rolling friction Consider Fig 3 Here the wheel is rolled in the direction given by the arrow C The removal of the points contacting at A is effected by the change of the instantaneous center of rotation from Ad' to the next point BP [See article "Bome Principles of Bail Bearing Design" in Scirn pounter remembers of nationaring transfa. In Bell's frite Assistant for November 6th, 1993 In making this change, A moves perpendicularly away from A' Likewise B approaches B' perpendicularly and as on throughout the roll—the points of contact ap-proach and recede from each other perpendicularly to the surfaces of contact

Now it will not be very hard to see that any move-ment of withdrawal that is oblique is really a compound of the perpendicular and parallel movements. We may provisionally assume that in so far as it is perpendicular it is a rolling friction, and that in so far as it is parallel it is a sliding one That there are such compound frictions may be seen by consulting the article to which reference has already been made.

the article to which reference has already been made. Now two very important commoning questions arise in connection with frittion. First, friction severs the contacting parts. This is a matter of very consider-able significances. Sevend, friction consume power in performing this abrasion in some cases, this becomes a matter of still greater importance. Some case, the becomes a matter of still greater importance where, they go had in hand—sub-less setteration of material and the still are still and the still are the still are the contact of the still are waste of the power used in accomplishing this destruct

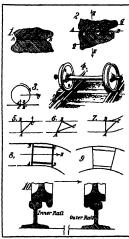

These two factors have, perhaps, been m These two factors have, perhaps, been more or loss recognized almost from the beginning of the age of machinery But it is only in comparatively recent years that their vital importance has begun to come to the fore. In every direction in the machine world this is testified to at the present time by the intro-duction of ball and roller bearings. These serve—with more or less perfection—to accomplish the exchange of more or less perfection—to accomplish the excange of silding for rolling friction. In the railway world, the antifriction movement is attested by the fact that large outlays are being made to eliminate the friction at curves. Reduction of time is no doubt also in view. But the railroads cortainly have in view the economic gain to be derived from the avoidance of that excee sive wear on rail and wheel which occurs when rous ing a curve, and the money advantage in saving the steam power wasted in effecting the wear and tear

steam pure wanter in miscring the vote not were arrived. That railway curves give rise to a very excessive amount of friction may be understood from the amount of war occurring at a certain curve in the "subway" of the Boston Elevated Railway Carbon-steel rails were replaced at a certain point, on the average, every forty four days. The amount of wearing down on the heads of these rails was about three-quarters of an needs of these raiss was about three-quarters of an inch. As to what happened to the wheels in accom-plishing this wear, no one has any exact information. But it must have been very considerable. Three-quar-ters of an inch was not worn off the rail head with-out a corresponding effect on the wheels and fraciss. What happened at this curre is happening, in

greater or less degree, upon all curves, wherever located. It is a matter of interest and importance, then, to consider more particularly the causes of friction at railway curve

Three prominent factors enter The first causal factor arises out of two facts. The outer rail of a curved track is longer than the inner one. And yet the one must be covered in the same time as the oth els and axles are so combined that two wh and the corresponding axie operate as a single piece. Consequently, the one wheel is compelled to rotate at precisely the same speed as the other. In rounding a curve, however, a greater distance is covered by the This conflict of rotational velocities between the two wheels results in slippage, and this of course means wear of metal and loss of power it is to be observed that this friction occurs irrespective of the speed of the train. For the difference in length of rall between the two sides of the track remains precisely the same, and this controls the amount of slip-page. The seriousness of the friction is accentuated,

page The seriousness of the friction is accentuated, however, by the speed it has been proposed so to arrange the wheels and atle that this slippage could not occur. This might be done in two ways. Both wheels might be rotatably be done in two ways. mounted, the axle being kept "dead"; or, the one

PRIOTION AT RAILWAY CURVES.

wheel might be made integral with the axle, and the other rotatably mounted That either method would be effective can scarcely be doubted, but practical railroad people do not seem to take kindly to wheels mounted rotatebly on an axia

mounted rotatably on an axis.

Whether they are justified or not, there is another friction factor which enters and which is of the greater weight. In order to get this clearly before the mind it will be well, perhaps, to consider the action of a group of fanged wheals on a rulway track. Suppose we take a single pair of wheals and the corresponding we take a single pair of wheals and the corresponding we have a single pair of wheals and the orresponding the single pair of wheals and the such wast be kept perpendicular to the direction of the size which is the case of the sizes pair of wheels, how Fig. 4. Now it will readily be created that the axis must be kept perpendicular to the direction of the ratio. In the case of the single pair of wheels, how will this be maintained? The two planes of the finance as the places of contact with the hadde of the shead of the rule in decket give some assistance. But this is practically negligible for the reason that a turinance would be competed, be destroy the perpendicularity of the main, see "or fine, a very allert disturbance would be competed, to destroy the perpendicularity of the main, see" and a carciality track. Consequently, some additional mission think be withined if we attempt to solve this problem by obstructing a truck of fiftee wheels; all being maintained maintained in their exhistive possition to easie other, we should not supposed. In Fig. 5, the triangle &BC we about the contraction of the relative position to easie other, we should not supposed.

represents such an arrangement, the wheel contacts being supposed to be at the vertices A,B, and C. This track would no doubt withstand any tendency operattreat would also could written and a tensestry operating to throw it in the direction of the arrow at C. But a tendency in the opposite direction would give rise to the situation in Fig. 8. If at no other time, such a tendency would arise at a curve in the track when the rail corresponding to BC tended away from the truck as a whole This condition of affairs is

rapresented in Fig. 7
The lowest number of wheels which when combin in a truck are competent to maintain themselves upor a track is four. The four-wheeled truck is come quently the unit that must be dealt with in consider ing the friction arising at curves.

Now when such a truck rounds a curve, the c Now when such a truck rounds a curve, the outse wheel of the forward and is the one which first mosts the change of direction. This is shown in Fig. 8, where the wheel at  $\theta$  has beguin to respond to the our-aures. The wheel at  $\theta$ , because the rail curves away from it, will tend to be relieved. The impotes of the truck is in the direction B. Consequently, there is a server grind at  $\Omega$ . And this condition obtains through-server grind at  $\Omega$ . And this condition obtains throughout the curve

No doubt if, during the time of rounding the ou the axies of the truck could always lie in radii of the curve, as shown in Fig 9, the friction arising from the rigidity of the truck formation would be largereduced, if not entirely eliminated. Inventors se ing to attack this problem must remember that the ar-rangement of the truck cannot be fiexible. The change from the rectangular form to that of the isosceles from the rectangular form to that or the monotone trapesoid must be sufficiently instantaneous. It must not go further than requirements demand. Further, conditions must be reversible for curves bending in the opposite direction Altogether, this is a very

her factor which enters is one neinted out he Another factor which enters is one pointed out by Mr. Edward Godfray. The track of the wheel is not horizontal, but inclined, as in Fig. 10. On the outside wheel of the forward sade the climbing tendency re-sulting from the effort of the truck to more if a stright lite forces the wheel flamps to some such pea-tion as that shown in the figure This saided, so doubl, by the fact that they greater speed is stillined doubl, by the fact that they greater speed is stillined Reverse conditions on the inner side of the curve cooperate to the slewing of the whole axis outward, be-cause thus a less speed is obtained on the inner side of the truck. Now the result of this slewing is to bring a very steep portion of the outer wheel in contact with the head of the rail. There arises, thus, a severe wedge action This is, perhaps, the most important of all the factors giving rise to friction at curves. It is due to a combination of the causes proscing the other two.

### ath of William A. Hide.

William A Eddy, well known throughout the country for his many kite-flying experiments, died recently after an illiness of several months. Mr Eddy's life was spent in the study of kite flying, to which art he contributed much that is valuable. Although a self-taught man, he did much useful work, particularly in kite photography Latterly he was very much inter-ested in aeronautics, to which his kite investigations

Dr. Czerkis of Vienna, who has undertaken a study of the chemical structure of cannabinol, the active principle of hashish or Indian hemp, gives the following graphic description of the peculiar intoxication which hashish produces. "It is as if the sun filuminated every thought that passes through the and every bodily movement is a source of joy es through the brain The hashish eater does not experience the kind of pleasure which is produced by the gratification of bodily spannames sure cross in the appreciance test state of passages which is protected by the granification of bodily applicate. Its feels the jet of one who hears good newton of the miser committy his gold, or the broken passages of the miser committy his gold, or the broken passages of the protection of the state of the surpress of the through the cross state of the committee of the surpress and the crystale passages are judgmen and these, without the committee of the surpress of

THE STREE OF AN ARMOVALES PROFILERS.

The street of the street of the street of the street of an appreau train by means of a fan assess absert on the face of it. One is agit to discount the power of a fan Aris such an intangible, impressionals, substancioses Suid, that it seems innecessible to detail sendent and the street of the street possible to obtain sufficient thrust against it to drive a machine of any appreciable weight. Yet this is what a fixing machine propeller must do. The result is obtained by making the propeller of such airs and driving it at such speed that when the machine is held stationary, the propeller will generate a current of art forwing at the rate of a hurricane. We know something about this power of heavy galler, and when we consider that an arroyalm propeller in capable of producing a moderate-sleed cyclone, it is easier to conceive or its exercing numbers in the continuous contract of the secretage numbers in the secretage numbers in the secretage numbers in the contract of the secretage numbers in the ttained a speed of over fifty miles per hour. In order to do this, the propellers must have been driven fast enough to have produced a current of air considerably more than this velocity, because the fluidity and elastic of the air is sufficie nt to cause a conside tiy of the air is sufficient to cause a considerable "silly" of the propellers, which reduces their efficiency to a large extent, depending upon the design of the pro-peller. Our frombeage illustration this week shows Mr. Rübert Latham's "Antoinstic" monophane under goding a test of its propeller. The propeller is revolv-ing at the rate of about 1,100 revolution per minute, which is about the rate of the average electric fam., but when we consider that the propoller describes a circle 6% feet in diameter, some idea of the volume of air set in motion by the machine can be conceived At a test made in England last fall, a thrust of 265 At a test made in England last fall, a threat of 36 prounds was obtained Supposing the motor to develop only 30 horse-power instead of the 50 at which of the 1st parties, this is equivalent to but 8.5 pounds per horse-power, which is about all the average propalier between the second of the 1st parties and 1st partie the rapidly rotating propeller is cut at two points by wide dark bands. These are shadows cast on the blades The shadows are, of course, intermittent, as they full upon the blades only as they come within the range of the shadows This suggests an experithe range of the sandows This suggests an experi-ment which was submitted to us some time ago by one of the readers of the SCHWILFIC AMERICAN He proposed to show the shadow of a man on a string The proposition appeared rather startling, but he soon strated that the complete shadow, showing a perfect profile of the man's face, could be shown on the string, provided the string were weighted at one end and whirled around so that it formed a hazy patch of reflected light similar to that produced by the paces of reneced ight summer to that produces by the perpaintenes of vision of course accounts for the haze in the first place and for the shadow as well, because both are intermittent, as an instantaneous photograph

The Fublic Seath System of New York City.
In a paper presented before Section 1 of the American Association for the Advancement of Science, at the Section meeting, Documber Sith, 1999, suttled "The Public Sath System of New York City," by William H. Hale, Ph D. Superintendent of Public Saths of Section 1999, and the Section Section Section 1999, and the Public Saths of Section 1999, and the Public Saths of the Section 1999, and the Public Saths of the Section 1999, and the Sectio

Prior to the consolidation of the surrounding cities Prior to the consolidation of the surrounding cities into Greater New York there was no interior public bath. All were located along the river front as floating baths. The first interior public bath in Manhattan borough was established on Rivington Street on the cast side of the city March 23rd, 1901, and has been the most crowded of any bath, on the average, for the

Newer baths opened on Pitkin and Montrose Ave-ues, Brooklyn borough, have had more bathers in hot uses, Brooklyn boringh, have hed more suthern in hot weather than any others. It is stated that on one hot extensed day 9,000 bathers used them. A third public substitution of the property of the 10 to 10

### THE RED OF THE "DANIEL TREET"

To the Editor of the Superira America Terrary

To the Editor of the Superira America as

In looking over some old files of the Superira

America v. to-day, I found in the issue of March 13th,
1897, reference of the building of the old merchant
ship "Daniel I Tenney," built at Newburyport, Mass, by John J Courter, Jr

ection with the storm now This item, in co-This item, in connection with the storm now raging, carries me back to eleven years ago to-day, when the "Daniel I Tenney" was lost off the coast of Scituate, in the disastrous November gale. The wrockage was strewn for miles along the whores of Scituate and Marshfield. A portion of the stern containing the name was thrown ashore opposite the writer's house I picked up some of the interior fluish of the cabin, and have made several pieces of furniture of it, which are prized quite highly by the owners is the sad ending of the career of that poble shin which so proudly braved the storms of old ocean so many years.

Perhaps some of your readers may be interested to know where the "Daniel I Tenney" laid her bones to

Sea View, Mass.

### THE INVENTOR OF THE STEAMBOAT

To the Editor of the Scientisk American
I beg to thank you for publishing my letter, as also for your courtesy in sending me the copies of your

I wish to point out that although I insist that it would be a most difficult matter to prove that any other of the so-called inventors have any just claim other of the so-called inventors have any just claim to priority, yet if any reliable proof of any "inventor" having produced a practically successful steamboat prior to 1748 is available, then I would once for all sink any claim on behalf of Jonathan Hulls, but in my humble opinion, from research I have made upon the subject, such is not possible. Therefore I boldly assort that he and he slone should have the great hon-ors ascribed to him. Will anyone refute that I claim practical success of his invention, but not

commercial success, and to do justice to an inven-tors memory, it should not be for the purpose of resor a memory, it abould not be for the purpose of re-quiring commercial success. He laid the foundation for commercial success this fact is undeniable, therefore why should be not have the bonors and dis-intection for his genius? Always remembering that he was many years about of his competitors.

I do not admit, what is so generally claimed, that it is not the man who invents, as the man who puts into actual practice, that is deserving of the hot Without the man who invents, there could not be any need Neither would he have any place for putting into practice that which he would otherwise have he knowledge of, had it not been for the earlier inventors

ppears clear that Jonathan Hulls, although the side-paddle boat had existed for many years propelled by both manual and animal labor, yet he was abso-lutely the first to suggest steam power to supersede both methods by steam propulsion. An original innovation of the stern wheeler And with his with the side naddles, his cisim to originality is made with the sing pagnets, his craim to originality is made doubly sure, always remembering the very early date of his invention and the very crude form of steam engine which then existed. Therefore the greater the honor that should be accorded to him

with regard to Fulton, no serious claim can stand in face of the foregoing. To put it mildly he was only a copylat in the matter of steam propulsion. I cannot too forcibly assert that Robert Fulton has no cannot too foreign seasor that thorse auton has no claim whatever, and this fact N S Arthur Daniel cor-roborates This gentleman asserts that "England should certainly set up a monument for Jonathan Hulls, as he was undoubledly the original inventor in England", and he further states "whether he actually built the boat or not is of no special conse-

have been able to provide proof that he did build his boat, and that it was a practical success quently, any additional proofs I have supporting him -- and they are numerous --would be quite superfluous. There could not possibly be more than one inventor of steam navigation, whatever adjectives b J. Hoores HULLS

Manor Park, Essex, England

## GLASS ESPALIER WALLS.

### BY JACQUES BOYER

In the cultivation of fruits on the espailer system the trees and vines are planted along a wall of stose or brick to with all their branches are arefully attached so as to spread them out into a plane sur for an all allow free access of light and sir to every part. Ordinarily the direction of the wall is determed to the control of the wall is determed to the control of the wall and the varieties of a state of the varieties of varieti

with refer nce to his di Until very rerection Until very re-cently if the wall was built in an east and west direction so as to expose one face to the south the one tace to the south the other face was almost ; tirely wasted. In order to remedy this state of af fairs several fr it grow ers have conceived the idea of employing trans-parent espaller walls through which the light of the sun can penetrate to the trees planted on the north side of the wall Comte Horace de Choiseul in particular has conduct esting experiments of this sort on his estate at Viry Chatillon in the Depart ment of Beine et Oise ment of Seme-et Olse and has obtained some very promising results. He built a glass wall 6½ feet high and about 60 feet long extending in an east

and west dire tion and

and west dire tion and planted fitteen pear trees of the variety Winter Doynu on each side north and south Ti baring surface of the wall amounted to about 26 squar yards on each side or The south side yielded 134 pears of a total weight of 31 pounds and the north side bore 119 and total weight of 32 pounds and the north side bore 150 pears within the 132 of sounds and the 132 of sounds and 132 of sound poars weight of 77 pounds and the north size nore its pars weight of 77 pounds making in all 245 pears with an aggregate weight of 168 pounds. All of the pears were of parti ularly fine appearance without blem ishes of any kind and it is a remarkable fact that the fruit which was gathered from the north face of the

fruit which was gathered from the north face of the wall was even smoother of skin than that which was produced on the southers side. Each square yard of the giass wall produced nine or ten pears of an aver age weight of about 11 ounces. Another atspringent with giass espailer walls has been made by MM Croux & Sons in their nursery at Val & daulary in the Department of the Solies. The wall which they constructed also lies east and west and consequently presents northern and southern ex

par yir g photographs show par yir g photographs show the wall is surmounted by a glazed roof projecting on each side Along on h fa e of the wall were planted Calville apples Win Doyen Passe-Crassa Winter and Directrer Alphand pears together with pea h trees and grape vines care being taken to place the same varieties on ea h con parison easy a d a u

In 1907 these trees and vines produ ed their first crop in which no differ en e betwen the fruit produvd from the north and so the sides of the wall old be deeted. The same result as shown by the ros of 1908 and 1909 There is indeed little

There is indeed little diff rence in temperature between the north and south fa es as he former is heated by the solar rays whi h traverse the gass and ite latter is cooler than the so th elde of a masoury wall for the very reason that some of the incident solar radi

through the glass and consequently less is reflected and absorbed. This difference in absorbing power how and absorbed This difference in absorbing power how wer makes the giase wall inferior to the mascar; wall in the matter of warming the plants and protecting them from frost night. A masoury wall absorbe a great deal of heat during the day and gives it out at ight but this effect is comparatively small in the case of a wall of glam

In the matter of cost there is little difference be-

A GLASS ESPALIER WALL GOUTH SIDES

tween the glass at d the masonry walls. The cathedral glass enployed by MM Croux costs about \$6 or \$7 per linear yard of wall 8 feet high including the cost of linear pard of vall 8 feet high including the cost of the giased roof projecting zowe both sides. A masonry wall of the same height would cost \$4 or \$6 a, pard and the addition of the giased roof which of course is equally necessary in this case would raise the total cost to \$6 or \$3 per linear pard More extensive and long-restituted experiments must be made however-belore it will be possible to procuouse a positive offsis icn concerning the relative merits of glass and ma-soury sepalier valls

There is now a prospect of a thorough, explicit can sus of the population of China. To grasp what this signifies one must first remember that China is vastly the most populous state of the whole world and second ly that hitherto such estimates of the number of its

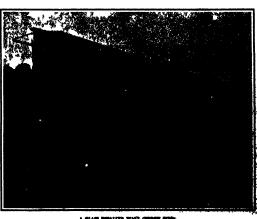

inhabitants as have been published have fluctuated between 100 000 000 and 100 000 000 any Commontly that the present day the number of natives in Othas is meetined as 400 to 400 millions, but capper pageragely are breath that number as greatly indisted. In many into books in consequence the resident finds only 300 millions ratied as the probable actest of the population Neutraphy in occurs to the thinker that the importance of all suppositions in regard to a yellow partie and the state of the suppositions of the stricker that the majortance of all suppositions in the thinker that the importance of all suppositions in the stricker that the majortance of all suppositions and the stricker is the supposition of the stricker is the supposition of the stricker.

pend very largely on a sure calculation of the size of the population of China Of course in the course Of course in the centre of former canturies the Chinese government projected and made at least the semblance of various consuces so that when they were published they were found to be mostly more statements of the approximate number of flam proximate number of flats illes and were therefore quite unreliable. And the shadowy value of such consume was not improved.

whichovy value of used comments was not improved by the way by the olds namer of the growth of the way by the content of the individual provents of the province who when a consens was ordered for the purpose of military constriction or of collection or apply the content of the property of the province was not the whole Chinace and in the double form most of a consum of families and a consum of individuals. The former is to be ready by the early part of 1910 the latter by 1911. In view of the immense status of the Chinese Happire the wasterness of this state can hardly be overestimated and the translated overwite by the present accellent organization of the Simpire though the fact cannot be ignored that certain parts of the Himpire does themselves wholly independent and will therefore resist in such districts or will try through the stiff the scenario for the construction of the construction of

# RUFUS PORTER AND HIS "FLYING SHIP."

BY C. E. McCLUER.

Soon after the Montgolflers invented their first "hotair' balloon, which was almost immediately followed by the first 'gas balloon, the attention of scientists and inventors seems to have been centered on the apherical and slongated gas bag as a means of flota-tion, and the provision of propellers and rudders to tion, and the provision of propellers and rudders to enable the navigator to control the movements of the unwindy and wind-tossed sphere, and produce what is now known and briefly described as a "dirigible" balloon Omitting all reference to the work of the many accomplished and venturesome balloonists who originated or copied the various devices which they adopted for the guidance and management of their spherical or pear-shaped, or elongated and cigar-shaped gas envelopes, we will revert at once to the

Rutus Porter, belonging to that numerous class of enious New Englanders usually styled "Yankee in-tors' was born at West Boxford, Mass., May 1st, 1792 and died in New Haven, Conn. August 13th, 1884 Although he received only a common district

varying success, his journalistic enterprise was pur-chased by the present proprietors of the SCHRYLING

nong Porter's less noticed inventions, and the one from which I presume he reaped the smallest recom-pense, was a flying machine, or as now styled, a "dirigible" balloon, but which he dubbed an "sere-As nearly as I can ascertain from the records at my command, this invention was made and pat-ented in 1820, but not until 1852 did Porter seem to make any serious effort to exploit the device. In that make any serious error to exploit the device. In that year he organised what he called "The Asrial Naviga-tion Company," and attempted to raise the funds neces-sary to enable him to construct his first seroport by an appeal to popular support through the sale of \$5 bonds or certificates.

bonds or certificates.

Among the papers of my decessed father I have recently found one of these bonds, issued to him under
date of April 28th, 1852, a facsimile of which is reprinted herewith

Below follows an abbreviated copy of the "proposi

not exceed \$35 per day it is ascertained by a misech and careful estimate that an aeroport 150 test long and capable of carrying five persons at a speed of sixty miles per hour, may be constructed for \$1,500. Now, having been disappointed of the funds requisite to put this invention in operation on a scale of practo put this invention in operation on a sense or prior tions utility. I propose that if three hundred persons will subscribe five dollars each, payable when the whole amount of 1,500 dollars shall have been subwhele amount of 1,500 dollars shall have been unbescribed, I will forthwith construct this pineser serroport, (which may be done in six weeks), and when this put in operation I can readily command the requisits funds for constructions a large servoport as aboves men-timed. And I will sea exrame that each subscriber on the payment of the safe mus of 500 dollars, shall be trunhed with a requirer title dock which shall estitis the holder thereof to one three-hound-roth part of the first servoper, and also to one three-hound-roth part of the first servoper, and also to one three-hound-roth part of the first servoper, and also to one three-hound-roth part of the first servoper, and also to one dollars and constitution and of all benefits and encolumned that may be derived therefrom for twenty years, the said asroport

PACSIMILE OF THE ARRIAL WAVIGATION COMPANY BOND WHICH SHOWS THE PORTER AUROPORT RESISTRIC CAR

school education, he possessed an alert mind and a retentive memory, which, coupled with a natural genius for observation and invention, fitted him ad mirably for an active and useful life. He early disnursiny for an active and userul life. He early dis-played inventive abilities of no mean order, as is at tested by the list or his patented inventions disclosed by the records of the Patent Office. Some of this patents displayed an acumen and foresight which led him into the van of progress, and proved that he was fully abreast if not actually alread of his time. Among his numerous patented inventions we find enumerated a cord making machine a steam carriage or ordinary road vehicle, prophetic of the latter day automobile, a ploneer treadmill horse power machine, a corn sheller, the inevitable Yankoe churn, a washing machine, a signal telegraph, and a municipal fire-alarm system, the latter doubtless being the forerunner of the largely adopted and efficient Gamewell fire-alarm

system, now so largely in vogue. In 1840 we find Porter as editor of The New York in 1840 we find Porter as editor of The New York Mechanic, the first purely scientific newspaper pub-lighed in the United States. The next year it was re-tflowed to Boston and the title changed to The American Mechanic in 1845, evidently not having made a pronounced success with the publication of The Ameripronounced success with the publication of the same-can Mechanic be returned to New York and begin the publication of another journal which he styled "Scien-tific American, the Advocate of industry and Enterprise, and Journal of Mechanical and Other Imp ments, on a cash capital of \$100. The first number of the new periodical was issued on the 28th day of August, 1845 After six months of struggle, with tion and prospectus" alluded to in the bond, as 1 find it printed in the imue of the National Intelligencer of March 19th, 1852

"THE FLYING BRIP"

"A chance to secure a cash income of \$10 to \$20 per week for twenty years by the investment of five

"It is extensively known that the undersigned has by theory and practical experiments so fully demon-strated the practicability of serial navigation that all who have fully examined the subject are convinced, who have fully examined the subject are convinced, and no person, even of those whose interests are ad-verse to its success, can offer a word of rational ar-gument against it. Several model machines have been constructed, and each of them has operated accessfully, and no of them, skitten feet long, car-ried a small steam segies, by the power of which the machines was proposited, and, being guided by its own machines was proposited, and, being guided by its own beim, travelled rapidly through the air, even against a breeze of wind, in direct lines or circles, according to the adjustment of its beim. This machine was wit-nessed and applauded by hundreds in New York and Boston and notices thereof were published in several source and notices thereof were published in several newspapers of those cities at the time Since those experiments were made the inventor has made addi-tional improvements whereby the invention is nove perfected. And it appears certain that a sate and perroted. And it appears certain that a mate and durable sortial ship (or aemport), expeble of carry-ing one hundred and fifty passengers at a speed of ninety miles an hour, with more perfect askey than either steamboat or railroad cars, may be censerveded for \$15,000, and that the expense of retuining it will to be kept in repair without expense to the share-holders. . Washington, March 18th, 1852. Rufus

While with the added knowledge and experience of while with the saded knowledge and experience of a half century we can see wherein Porter was mis-taken in his calculations and visionary to a consider-able degree, we can also see wherein he was in adtaken in his exiculations and viriouary to a considerable degree, we can also see wherein he was in advance of his day and generation, and prepared to achieve the seconds that later and quite recently achieve the seconds that later and quite recently scholerable and the second that the present day, had he but been in possession of the passilite or handowly more as always applied to circular printed on the bond, one channel help being struct with in recentlance to the bonders directly height printed on the bond, one channel help being struct with in recentlance to the bonders directly height printed on the bond. INITATION WARRIN

A simple method of imitating marble with all its beautiful velo markings spots, and irregular lines and variable colors, is as follows

ne skill in giving the veining, etc, to the product will be quickly attained by making a few small slabs in a plain way previous to undertaking the production of a larger number The colors for the veining must all be of a mineral character, as follows plus (black lead), chrome green (dark), common crocus,

IMITATION MARRIE

yellow other, red oxide of iron, and ultramarine blue Procure a few pieces of stout sheet glass, say 7 inches by 11 inches (an ordinary 11 x 14 photographic nega-tive cleaned and cut in halves is just the thing) Make a wooden frame of ½ inch board, an inch deep with a division in the middle, simply held together with I inch iron brads not driven firmly in Leave of an inch projecting so that they can be easily withdrawn with a pair of pilers. Arrange these strips of wood, after being smoothly planed all over, so as to give two squares of five inches internal

Make up the following in a bottle ounce, benzine, 1/2 pint Place this, well corked in a warm room to dissolve, aid this by shaking it occa a warm room to cassove, and this by shaking it occasionally. When the paradin is dissolved it is ready for use. Brush some of this preparation all over the inside of the wooden panel. Then take a piece of Canton Sannel or soft rag, wet it with the bearine mixture, rand this well all over the smooth side of the glass plate, polish it thoroughly with two pieces of soft rag until there appears to be nothing left and place the frame upon the glass plate Now lay a mirror, or a piece of plain slivered glass upon the work bench, or table, and place a block of wood at each end so that the glass plate and frame will rest about four inches above the mirror the frame he-ing held in place by a couple of rubber bands Place a teaspoontul of throme green in a small saurer and a teaspoontul of black load in another saucer and add a dessertspoonful of water to each

Mix the following in any suitable vessel (a small stoneware pitcher being well suited) To ten ounces summers piccar using was suited). To ten ounces of water add sufficient plaster of Paris to make a mixture of the consistency of thick cream. Skim of the air bubbles and any dust that

may float on top, when in the course of a minute or two the plan course of a minute or two the plas-ter must be poured carefully into one side of the square on top of the giase plato. Fill this nearly half way. Pour the remaining portion into the other square. Now dip a small brush into the mois-tened black lead, press it through the soft plaster and paint the plain or recommendation. or sig-sag veining or spots. The plaster blends beautifully with the color and the mirror enables one color and the mirror caables one to see the affects produced. Any line made too strong or lumpy in the made too strong or lumpy in the produced of the produced of the forest of the for

anne way. Eaving now produced the velating, the block may be refindreed as follows; Have ready to hand a few pieces of gathwhiled twen netting. Out a place this place was the symmetry of an hash or introduction of the piece with a quantity of an hash or introduction becomes on the piece with many one attention to the piece with many one attention. In the same pitcher that the planes was those down many the same quantity of protripts of many pieces down many the pieces with many one attention. The same appearing to protripts of protripts of protripts of protripts of the pieces of the

small quantity at a time, pour the mixture upon the plaster and wire netting until the panel is filled. Treat the second square in the same way, allow the Treat the second square is the same way, allow the whole to stand for an hour, nutil both plaster and cement have become value set. As soon as all has become well set, draw out the brade with a pair of pliers and remove the woodwork carwfully. This will hasten the drying Take care not to shift the cast blocks upon the glass plate Let them become quite dry while in contact. When dry the colors will not dry while in contact. When dry the colors will not be more than one-third as brilliant as when wet, the be more than one-third as Drilliant as when wei, the effect being precisely like marble. The face of these blocks will possess very smooth surfaces with only a partial gloss upon them, being at the same time por one. The poresity can be stopped and the gloss much improved by the use of amplacetate colloidion. This is practically a solution of gun cotton in amylacetate which not only fills the pores of the plaster, but forms a coating as clear and transparent as water. It re-sists the action of weak acids and alkalies and can be washed with water and a chamois leather at any time without injury to the object it covers

When the squares are perfectly dry and slightly arm they must be placed in a plate or large saucer, containing a mixture of amylacetate collection and one containing a mixture of amylacetate condon and out-third amylacetate. This thin collodion will penetrate the porce of the plaster for a quarter of an inch or more in a short time. Remove the square and stand the porce of the plaster for a quarter of an inch or more in a short time. Remove the square and stand on one corner to dry in a warm place. When dry a couling of the thick amplacetar collection may be brushed upon the surface and silowed to drain from the opposite coner. The surface will improve in brightness with every coaling. Amplacetate collection costs about two dollars per gallon at any wholesals chemists. A gailon will go a long way in water-promise such also be finitistion marbin as here described

much harder material with a slight grain can be produced by mixing a small quantity of ground pum tee or ground glass with the plaster which must be intimately mixed to insure uniformity. This mixture or termed Parisa coment. Imitation marble orks can be made by the above process into any shape such as a keystone for a mantelplece or circular with an inlaid border and in many other ways that will suit the taste of the individual worker. In place of Portland cement, Parian cement may be used as de scribed above, thus producing a slab of an almost un form color. Any size of slab may be made as described.
Of course the thickness must increase with the size of the slab to give strength

### SOME CURIOUS CHEMICAL SROWTHS

BY ALPRED P MORGAN The following experiments are somewhat out of the ordinary but may be performed with the materials at hand in any chemical laboratory, or obtainable at a well-stocked drug store

first experiment mercury is prepared by in the first experiment mercury is prepared by throwing into it small pieces of clean metalik sodium. The sodium will almost immediately take fire and have a hard crust on the surface of the mercury. Break this crust with a glass rod and stir it in the mercury until it dissolves. The little pill bottle on the right in the illustration contains five cubic centi meters of mercury having sodium dissolved in it The tumbler on the left shows five cubic centimeters trans formed into 'ammonium amaigam,' and occupying a space over iffty times the original volume of the mer-The transformation was brought about by

PLANT-LIKE GROWTHS DUE TO CHMOTIC

throwing the mercury juto a tumbler containing a throwing the mercury into a tumbler containing a strong solution of sal ammoniate in water The mercury immediately swells up into a spongy mass. The time elapsing between the moment when the sodium analgam was thrown into ammonium chierde and the taking of the photograph illustrated here was about thirty seconds.

The reaction may be represented as follows '(Na dissolved in Hg) and NH,Cl = (NH, dissolved in Hg)

mination of the mass, it is seen to be very

spongy in nature, and its growth in all probability caused by the evolution of a gas. This is indeed the true explanation of the phenomenon The NH, of the ammonium chloride dissolves in the mercury but soon the mass decomposes, and bubbles of ammonia and hydrogen gas cause the enlargement.

in a few moments the mass will begin to sink, and a strong smell of ammonia will be noticeable. If a lighted match is held over the small bubbles arising righted match is need over the small cubbles arising from the liquid, they will burn, lighting with the "pop" indicative of hydrogen The mercury will soon re-turn to its normal condition, in accordance with the following equation

2 NII, dissolved in Hg = 2 NH, + H, + HThere can be no doubt that the NH, is actually pres ent in solution in the mercury, for when a sait of am monium is decomposed by electrolysis, the NH, ion monium is decomposed by discriptions, the NH, ion upon its discharge given ammonia and hydrogen and no NH, is formed But if a pool of mercury is used as the negative electrode the NH, dissolves in the mercury and forms an analgam with it. However, during the formation it swells up and gives off the products mentioned above

GROWTH OF ALUMINIUM OXIDE ON A TELEPHONE

The most interesting point about this experiment is that it is in accordance with the theory that ammon lum would have the properties of a metal if it could be isolated for excepting this substance the metals themselves can only be dissolved in mercury

The second photograph is an illustration of an ex-oriment depending upon the peculiar property of aluminium amalyam

The action of sulphuric and nitric acids upon ordinary aluminium is very slow because the metal re-ceives a coating of aluminium hydroxide and is shielded from the acid, but if the aluminium is amal gamated with mercury, the action is very rapid

Aluminium has a very great affinity for oxygen, and will displace all the metals save magnesium from their oxides. If a mixture of aluminium powder and ferric oxide is placed in a crucible, and fired by means of a place of burning magnesium, a violent reaction takes place enough heat being produced to leave the iron, which is one of the products in a highly molten state. This is the principle of the "thermite" used for weld ing, et

### $F_1 O_1 + 2 A1 = A1.0. + 2 Fe$

Some idea of the speed of reaction and the heat generated may be gained if three small iron crucibles are placed in a virileal column, one above the other and separated five or six inches. A mixture of aluminium and ferric oxide is placed in the top crucible and ig-lifed. Almost immediately molten from still melt its way through the bottom of the first crucible and pass way through the bottom of the first crucible and pass way through the bottom of the first crucible and pass through the second and third as if there was nothing in the way. A box of soud should be placed beneath the bottom crutible to catch the molten metal. The affailty of aluminium for oxygen can be shown

by amalgamating a piece of the motal with mercury. The surface is almost immediately oxidized and the result is a growth of white tufts of aluminium oxide over the tutts of aluminium oxide over the surface of the inetal where it has been amalgamated. The growth will rise about one eighth of an inch or more in five minutes.

The englest method of amales. mating the aluminium is to clean a small portion, and then drop upon it some mercuric nitrate solution and allow it to dry. The growth

will immediately commence in the illustration, the case of an aluminium backed telephone receiver has been used for the experiment, and the resulting growth is shown by the white spots, principally on top at the left

The third photograph is a striking illustration of osmotic pressure. The tail plant like growths may be formed by throwing small pleces of any of the follow-ing crystalline chemicals. Ferric plicate copper shoring crystaline chemicals terric nitrate copper tunor die cobait intrate, fickel sulphate and manganess sulphate into a beaker glass containing a diluted solution of sodium silicate of il specific gravity. The crystals will almost immediately sprout up into vari ous fantastic shapes, and grow several inches in the course of a few minutes.

The saits dissolve in the water of the sodium sill

A SPONGE-LIKE TRANSFORMATION AF MURGERY

cate solution and react with the sodium silicate to form a silicate of the metal of the salt added. For instance in the case of copper chloride copper silicate is formed

(ucl, + Na,BiO, = Cu8iO, + 2 NaCl
Billicate of copper is insoluble and so the result of
the reaction is a small portion of liquid around the
trystal of Cutl, surrounded by a sack of insoluble
Cu8iO where the copper chloride has come into con tact with the sodium silicate

Particles of a dissolved sul stones exercise a pro similar to that of a gas explained in physics texts under the title of the kinetic molecular hypothesis. When the sa k is first formed the pressure is equal

on both sides but as more of the copper chloride dis on both states but as more of the copper coloride un-solves the pressure on the inside of the suck becomes so great that it bursts at the top where the hydrostatic pressure of the liquid is least and the suck weaker The liquid apurting out of the top is immediately

surrounded by a new sack and the process continues until the salt is exhausted or the growth reaches the e of the liquid

The silicates of the metals of the saits mentioned in the list above are also insoluble and the same explans tion holds true for their action

### WIRELESS EXPERIMENTS WITH A STATIO

MACRINE

In the large quantity of literature on wire graphy practically the only method described of pro-ducing the high tension currents required is that of using a powerful induction corrects required is that of using a powerful induction coil or a high tension trans-former on an alternating current. The possibility of utilizing the discharge from a direct generator of static electricity is herely touched upon. In order to t at the practicability of the use of such a source of current the writer constructed a static machine of the Wimshurst pattern and made some experiments with Wimmburst pattern and made some experiments with it. The machine a photograp is of which is shown herewith was fitted with two glass plates twenty insher in diameter supported on a half inch steel shatt Each plate had thirty sectors of heavy tinfoil 3½ linches long. The brass work was made from 116th round rod and the brass bails on the oblictors and Leyden jars were pur-

chased from a manufacturer of brass bed steads as were the large balls terminating stead as were the large balls terminating the discharge rods and the sending device below These balls were filled with crushed tinfoll and contact made by inserting the supporting rods in wooden bushings fitted in the necks of the balls

in the necks of the balls

The two Leyden jars showing at the front of the
machine were made from hydrometer glasses provided
with feet and each had a combined inner and outer
coating of 85 square inches of foil The interior out coating of so aquart incress or for I has interior out. ings were arranged to be connected with the discharge rods by short loops of brass chain and the exteriors joined with a similar chain laid along the base of the machin. The device shown attached to the front support is the key by which the spark is thrown into the aerial and ground and the messages sent By pressing the lower lever the rocking arm above it preasing the lower lever the recking arm above it with a supports the two insulated balls is pulled upward and the latter are thrown into range of the spark from the dish harpe balls in onnected to the serial and the other to a good ground such as a gas or water pipe 1 found it best to allow the acrial ball to take its charge from the positive discharger By pressing the key for longer or short; intrivate the dots and dashes of the code are easily obsticated. are easily obtainable

An acrial was r (ted on my roof at a beight of 45 feet above the ground consisting of two horizontal copper wir s supported on two-foot spreaders with leads off n ar the center running to the edge of the roof where they were joined and a single wire ied then a to the nachine on the third floor. This aertal gave a wave length of about 72 meters. Owing to the extra rely high tension and evanescent nature of the discharge it was ne essary to insulate the wires with ar at care which was done by supporting them in par affin I plass tubes. The machine as constructed gave

a solid siream of bright twoin h starks re sembling those from an induction oil was chark balls were use I and the jars uncon nected With the latter in cir cuit in the usual manner a very powerful spark of about the was obtained at intervals. With a large bell on the right hand rod and a small one on the loft, a mach thinner and more frequent spark from five to six inches long appeared. The first experiments in scading messages were con-

ducted with the receiver in a room about thirty feet away from the machine, using a gaspipe ground and

Fig 1 -- CRATING WHICH GIVES THE COLOR

no receiving serial A number of detectors were one structed experimentally in luding a coherer and de coherer with a ¼ inch gap filled with nickel silver fillings a microphone consisting of a piece of hard pencil lead bridging two stoel needles a bare point electrolytic and a Marconi magnetic detecter. In all the tests made the coherer gave the best results at short range and the microphone the best for long indeed the sounds were much cle distance this case than when the electrolytic was used though the latter is considered the most sensitive of all

For S -DIAGRAM EXPLAINING THE COLOR ILLUSION

In these experiments a home made relay of 200 chms resistance was used with the coherer and a pair of 75-ohm ear phones with the microphone. In the experiment conducted in the near by room the straight experiment conducted in the near by room the stranger spark from the discharge bells was used and gave clear signals. The coherer was then moved to the back yard and provided with a ten foot aerial stretched horisontally six feet above the ground the other connection being to a water pipe. The signals were still received charly but on increasing the distance to three hundred yards no result was obtained with either eiver although the serial was extended to a length of thirty feet

crease the power of the spark the inner coatings of the lars were conne the outer coatings still remaining un-

By this arrangement a shorter thicker and more brilliant spark was thrown into the key balls which while not as frequent as in the former case was suffi ciently continuous to easily permit sending distinct dots and dashes when the machine was driven at a dots and dashes when the machine was driven at a slightly higher speed. The microphone now responded clearly when the key was worked showing the in crease in efficiency of the new arrangement and a more ambitious experiment was decided upon "he more amounts reperiment was occased upon "ne receiving station including microphone telephone receiver tuning coil batteries, etc was transferred to a house three-quarters of a mile away and a receiving acreal erected As the owner of the house objected to the use of the roof for this purpose I was compelled

is year up a pichler testificials función et e vertical type, protection flows in high-printy reads delinear protection flows in the protection of the printy protection of the printy protection of the printy protection of the printy flow of the printy

of Leyden jars and so send greatly increased into the aerial and increase the radius of ef-The drain of the spark gap showing the character of the spark as given from the interiors of the jars alone as used in the foregoing experiments are shown in one of the photographs. The receiving apparatus with the exception of the tuning coil is also shown

### A COLOR AND RELIEF ILLUSTRE

Hold a pin vertically with its pointed end between the thumb and forefinger Place the pin thus held before your eye in contact with your cyclid Close the other eye and look at the drawing Fig 1 this bring at a distance of about three to five inches from

bring at a distance of about three to dree inches from jour eye. Two differently colored gratings apparently placed at two different distances from the eye both of them made up of vertical lines will immediately appear to be a second to be relatively near its lines have a dark brownish have The other is made up of dark bluish as a distance behind the first grating if the figure be moved laierally the near-by brownish lines are seen to move on with the paper but the bluish bars run in the op-near distretion.

the paper but the bishab hars run in the oppositic direction

The near-by brownish bars are the black
stripes of the figure In spite of the finct
that the distance between the figure and
to the stripe are not much blurred as the pit of
creases the aperture of the pupil and thereby increases

the depth of focus

The far away bluish bars are the shadows cast by The narway ordina data are in a mandows cast by the pin on the retina in the middle of every luminous bean sent by the corresponding white line The shade is cast right side up but the retina inverts it and the result is the curious inverse motion of the blush bars when the paper or pin is made to travel

interary The origin of the bluish color of these bars is shown on Fig 2 L L is the cross section of a white line The pin P (relative size is exaggarated) closes shown on Fig. 1. Let be rose sections of a winds as the accurate prior of the cruralities less and as the achronatum of the persphery is imperfect there is a rather strong dispersion of the white light. The bine rays R B of the shaded spectrum invade the obscure central sone which is the shadow of the pin. This assumes a birish hue. For a similar reason the less retrangilate olorer red and relive high pinh dead of the white like. The assumes a birish hue. For a similar reason the less than the contract of the white likes. The admixture of colored light to the dark stripts in increased by the fact that the whole image being out of from the limit between the black and white lines councils to sharp.

# (O)Holiside from page 21.) gal force effected by the band, causes

the ball to swerve during he man. ...
this operation, though the hand is revolved, the drum upon which the ball
jests in the palm or one is stationary.
This device is brought into action when hall to swerve during its flight. In This derive is brought into action when it is desired to give the ball a "ippin." There is a grove in the drum in the pain over which a band is passed, and which by mitable arrangements is carried to the same points as the "werre" pulsers. For imparting a pure spin to the ball, the pulser youting the hand as above described is thrown out of action, and simply the drum in the pain upon which the ball rests revolves during the crews of the arm on an axis nextled with water the ball rests revolves during the travel of the arm on an axis parallel with the drum and at right angles to the line of flight instead of revolving on an axis parallel with the line of flight, as in the action to produce swerve. If desired, both actions can be brought into use at the same time, and then the ball is given the same time, and then the call is given a compound or refractory gyration—which combination of swerve and spin—which delivery puzzles the most accomplished batsman because of the erratic and con-

stantly varying rotary axis of the ball. The device is aptly suited for practi and certee is a puty surfect or practis-ing purposes. The velocity of the bal-can be altered at will, and there is a "velocemeter" mounted on the machine to indicate the exact momentum during flight. The variations possible are very tensive, and no two successive balls and be delivered alike, the change being sected without the batsman being aware effected without the batman being aware of the fact, or if desired a cartain type of delivery can be repeated of fib Kerry gration can be appeated of fib Kerry protone the disverse of any particular protone the disverse of any particular bowler. The "break", i. e., the tangent to right or left produced when the ball strikes the ground, is measured by graduated sight, which also indivises the granular produced sight, which also indivises the erve of the ball to one side or the other during flight Similarly, the ball can be made to leave the "hand" at any point of the arm's travel, there being a series of stops to secure this end in this manner the pitch of the ball, that is the distance from the machine to the point where it comes into contact with the ground, can be easily varied, and similarly the ball can be made to strike the ground in such a way that after the im-

pact it shoots forward at great speed The machine is mounted on telescopic legs, and the height of the delivery of legs, and the height of the delivery of the ball can be made to coincide with that of any bowler whom it is desired possibly to imitate, the variable range be-ing from six to eight feet above the ing from any to eight feet above aground. The mechanism is also arranged to swivel on its body, so that the bowling arm can be pointed in any direction without moving the body. The arm is brought to the horisontal position by means of a lever, by which it is also trained and re d, and at the same time a disk is raised to warn the batsman of the im-pending delivery Every ball delivered is moreover registered automatically upon a

### MONARCH LIGHT TOUCH

the MONARCH Typewriter should interest the eas man, because of its distinct commercial value to him; it means MONARCH operators are able to produce more work in a day

To the operator, MONARCH LIGHT TOUCH means an even day's work and "No 3 o'clock Fatigue," owing to the fact that it is so much easier to operate than any other typewriter.

We welcome the opportunity to demonstrate this and many other MONARCH advancements, and solicit correspondence from those interested.

The MONARCH is made in regular carriage and several wide carriage models-all shown in our literature which is gladly sent to all who write for it.

not be determined without further examinate. Much smaller quantities of graphite occur as fakes in many of the granultee and in the crystalline limestones, when it invariably forms small tabular straided crystals with well-devloped band cleavage. In these cases, according to Dr. A. Commarsswamy, the dispute the page 50 pt. A. Commarsswamy, the dispute the page 50 pt. A. Commarsswamy, the dispute 50 pt. A. Commars, and there is no reason to suppose that it has been subsequently introduced.

Evidently the graphite in the ve been deposited at a time posterior to the consolidation of the granulites, and they are of the most typical character Usually are or the most typical character Usuany they consist of pure graphite with occa-sional evidences of more than one period of deposition in a soned structure of the vain Metamorphism of the surroundvain Metamorphism of the surround-ing rocks hear the voits is found on only a small scale, the rock surfaces in imma-diate contact with graphite being impreg-nated with the carbon ne more than about half an inch Neither are the quarts and other interests associated with the graphite with filled with dis-seminated graphite, the latter occurring only in strings filling cavities or cracks in

the quarts. It is evident that the depo-sition of the graphite must have been from vapors or liquids asturated with mineral (carboniferous) matter. The best producing districts are Ke-galla, Ruanwells, and Pasdum, but areas are found over the island with the ex-ception of the northern and eastern por-tions. The mining is almost exclusively in the hands of the natives, and primitive methods obtain. There are but little or methods oftain. There are but little or-ganised means of prospecting A villager stumbling across evidences of graphite immediately completes arrangements for working it. A pit is susk until the vein or deposit is gained, and the mineral exor deposit is gained, and the mineral ex-tracted until the yield fails. When walk-ing through plumbago areas, numerous abundoned shallow pits may be seen alongside the roads.

the quarts. It is evident that the depo

shandowd shallow pits may be seen alongside the roads.

In the richer districts more methodical working is adopted, but even here there is a quaint antiquity about the substance of the respective of the respect

with the mineral which under the fric
tion of the bare fuch has a most brilliam
polish and is dangerously slippery ex
rept to the active mevements of the

The graphite is excavated by qually crude tools and instead of being helsted to the pit mouth by role and jull y is loaded into tall baskets of nativ n anu facture resembling small barr is loaded on the shoulders of the native who car ries it bodily up the long ladder to the lit mouth As a result in a busy pit there is a constant endless train of as there is a constant endiess train or as creating and desconding natives bearing their baskets swarming up and down like flies their bodies covered with jumbago brightly polished giving them it ap-rearance in it suplight of moving fig

ures wrought in bright steel
Should the pit become flooded a simple system is adopted A rude conduit formed of lengths of wood placed diago nally together so as to afford a V chan level a small orifice being bored through the side of the pit if necessary to secure
the outlet. The water is baled out by na

ives equipped with small vessels
At one or two of the pits where the velus are abnormally thick some pre-tunes to modern mining methods is made. The water is removed by the aid of steam jumps and the native arriers are dis-laced by pover hoisting jiants hauling the mineral from a d jut of fire of the nundred feet to the surfa At Pela watta the most ext naive workings in the Paduu korstel, such an installation has been laid down and her the prevailing conditions warrant it coulds for s i h machinery sin one main vein striking north and south has a maximum thick ness of twelve in hee Owing to the heavy

owing to the heavy demand for graphite that ensured as a result of the South African war when \$31 per ton was realized a plumbago fever broke out among the natives Su h a price induced indi vidual working and illicit mining on crown lands Even to-day the latter traf-fic takes place Should the mineral be no takes place. Should the mineral be proved to exist on the government prop-erty licensus are duly issued by the authorities to respectable individuals to exploit the deposits but the natives re-

ort to poaching

The graphite as it is mined is taken to the cleaning and grading works. It is first submitted to a preliminary hand se lection all the large pieces which are lection all the large plocts which are for the most part pure graphier or are associated with pyrites and scientic be-ing pisced on one side. The sixves com-prise across of varying mesh stretched on wooden frames inclined at an angle over which the mineral is emitted from small shallow baskets and then rubbed by hand the larger or coarser pieces fall ing to the lass of the screen while the minute particles ; ass through the meshes This process is repeated several times work being commenced first on the small est meshed acreens in this manner the dust and much of the friable loose earth is separated. This phase of the work is carried out by women and children

earried out by women and children illifting completed the graphite then undergoes leaning. The product being brought in from various localities may be found associated with other nature nath as tronstone or carbonaceous d posits of various descriptions and this deletations material is removed by hand. This op-eration also serves to separate the min

eration also serves to separate the min eral into two qualities the market price of which averages from \$17.0 to \$200 per ton for the first and from \$4 0.0 \$115 per ton for the second grade Thi Industry has attained great properity apward of \$30000 natives being sun poyed in the mining of the article the value of which production considerably exceeds \$5000000 per annum The in dustry is also for the greater part in the hands of the natives many of whom dustry is also for the greater part in the hands of the natives many of whom have amassed considerable fortunes since owing to the cheapness of the labor, ample supplies of which are readily avail-(Concluded on page 39)

# Stop Guessing!

THE old way was to buy coal by weight. You paid for everything that came in the car. Now you can buy coal according to what it will do under the boiler.

Two coals of the same price. appearance and texture do not necessarily have the same heating value. The one containing the lower percentage of extraneous matter is naturally the more economical, because it produces more heat per ton.

If there is a coal that will evaporate more water per pound than another coal-you want that coal.

Pardee is a bituminous coal that has a reputation for doing iust this.

Pardee Coal is all mined in one basin. It's uniform, We employ a mechanical engineer who is at your service without charge.

His duty is to test Pardee Coal to insure its being kept up to standard. This is in the interest of our patrons.

Pardee is low in sulphur and ash. It's economical. We can prove this to you. Write us for any information about

able, while the capital outlay is said!,
a handsome profit is secured. The indus-try is however somewhat controlled by
the government, which levies an export ity of about \$2 per ton, representing an enual contribution to the revenues of the island of about \$100,000 The In creasing extension of crucibles in the metallurgical industries, and the result nt increased demand for graphite is re consible for the present flourishing con sponsible for the industry

Aluminium, as is well known is ex tracted from clay and it was Napoleon who styled it the "silver of clay" Formerly it was the practice to extract it from the clay with the aid of retorts More recently the electrical current is employed for this purpose with marked success, the cost of producing this valusuccess, the cost of producing this valu-able and by no means fully utilized metal, having by its employment been very much reduced in 1850 a pound of aluminium cost about \$40 nowadays it costs only about 20 cents. Above all other metals, aluminium has the gree cific lightness with the greatest durability and toughness It can be rolled, cut and drawn exceedingly fine This has made aluminium valuable and useful in the textile industrics. For many years, woven sleves or screens have been made of aluminium, which have proved indis-pensable in the sugar refining industry Its principal advantage consists in the fact that the surface of the aluminium, on the slightest exposure to the air beon the signification of the sir of comes covered with a coating of oxide which is capable of offering almost per fect resistance to foreign influences such as a tids, etc. This is likewise of great importance where supports in the control of the nportance where sluminium is used in

importance where annuming is used in the textile industries Speaking of actual weaving of alumi nium into special fabrics, particularly such as are intended for use for decorative purposes and costumes, it may stated that this is well and successfully practised in England. At the time of the Paris exhibition, there were shown as special attractions fabrics and clothes special attractions fabries and clothes made from fassa fib.rs. They were made from finely spun glass with silk. The fabries made from sjaminium do not need combination with other textle yarns Of late the most beautiful effects have been obtained by employing aluminium in smooth as well as twisted threads for the warp and as the weft slik varn of any desires color. They are silk varn of any desiree color they are used for evening cloaks and theatrical contumes. As the Pavill Woche says it makes the body of a beautiful woman look as though dipped in silver From aluminium, they are now making neck cloths pompadours showe belts neck these hawds and hais, and it is hard to mean the a little for the promesults. In little for the possibilities of the property of the prop prescribe a lin it for the possibilities of this metal. Very striking are not fabrics in combination with aluminium which constitutes a select novelty for interior decoration. Aluminium yarn made up into laces for ladics' shoes as well as used for straps, promises to be a feature of the coming season. constitutes a select novelty for interior

It would be quite an advantage to the notorist, states a contemporary, if he could communicate by wireless a hybridess a hybridess a hybridess a hybridess and his garage or the nearest repair abop in case of accident. An American inventor who is developing a system of wireless telephony recently made experi ments with portable apparatus to deter-mine the range of service of the instru-ment. He was able to communicate over mesh. He was anothe communitate over a short distance with a garage in New ark, but at a distance of eight miles the apparatus failed Apparently wireless (elephony will have to be developed far bayond its present efficiency before to an be of service to the motorist. The can be of service to the motorist. The chief dimouty is that only a anort trans-mitting antenna can be used, requiring an enormous expenditure of energy to reach a city garage, because of obstacles in the way, such as steel buildings, trace, wires, etc.

### Think of it-\$485 for the best-built, most thoroughly proven, easiest riding, most economical, handiest small automobile in the world!

THE NEW BRUSH RESSHOLL not only out-classes all small cars but is far alread of its own previous high standard

previous fight standard. Even though we have learned the lessons all manufacturers have to learn by openions—even though we have manufacturing facilities as marry perfect as money and braine can make them—still we could not build a car of the quality of the 1910 Brush if we merely initiated the lag cars with all their ecompleated parts and all parts necessarily smaller and weake

Here's where the genus of the designer counts The Brush has always been and still is the only real Runabout built in America

The new 1010 Brush is not a designer's dream The new 1910 triain to line a designer's circumbut the result of years of experience and a knowledge acquired by manufacturing 3,000 Brushes that are in daily use. It is a car which with one chassis adapts itself perfectly by change of bodies to a hundred different uses.

It is a car new in power, smoothness, speed and looks but built on proven principles by an organization already perfected

The Brush has the fewest possible parts but they are of sufficient size and strength to stand the hardest knocks

SIMPLETTY makes it prosable to build the car right and still sell it at this wonderful price. Vs. for reliability ther is no comprison be-tween the British and any of the small unitations of large multicest under cars. With the new Brisil you get single-cylinder simpletty, reliability, light weight low gas-dute and oil consumption, low tire experies with four-ceithing power and smoothings.

Its new balanced motor runs as quietly as a four-evhider and is as flexible. Its power is astonishing

The most wonderful improvement in Motor

The most wonderful improvement in suom Car construction in years. While the balanced motor is the most remark-able feature of the 1910 Brish, we have made numerous other numerous and refinements.

numerous other nurrowinents and refinements. Here are some of them wheel-lase keighbened 6 inclus more graceful and rakesh lines. ### BRUSH RUNABOUT COMPANY, 187 BALTIMORE AVENUE

# THE WHITE GASOLINE CAR is in a class by itself

If you plan to buy a gasoline car, why not get the very latest construction? You can find it only in the White, or in the 1910 foreign cars at double the White price.

The White gasoline car is at least one year ahead of any other American-built machine. Some of the advanced features of the White, which are not yet found in any other American car are:

"Long stroke" engine
No external manifolds
Heated intake
Water-cooled exhaust

Among the White features which are not found in any other American cars, except those of the highest prices, are:

> Four-speed transmission Imported cylinder casting Bosch magneto

The above features, combined in good design with the best materials which money can buy, and with the famous White

workmanship make the White gasoline car by far the most desirable on the market.

We venture the prediction that the principal changes which will be made by progressive American manufacturers during the next year or two will be the adoption of the features which are found *now* in the White gasoline car.

The price of the White gasoline car ranges from \$2,000 for the Model "G-A" touring car to \$3,800 for the Model "G-B" landaulet.

Even if you desire a smaller car or a larger car than the White, it will be to your advantage to inspect the White or at least to write to us for a copy of our catalog, in order that you may inform yourself as to the latest developments in gasoline car design.

#### THE 1910 AUTOMOBILE

ONVINCING vidence that the automobile of today is as far profested as the matrials of construction and mechanical in grainty will allow, in a stored by the fact that the cars shown in the two annual exhibitions that it is provided to a residual character as wore it not for the relatively short life and high cost of the tirre, the automobile would sarrly be entitled to rank as the most perfect and economical means of the present day. As to whether some cheaper and more durable substitute, having the same resiliency as rubber, will be found during the same resiliency as rubber, will be found during the same resiliency as rubber, will be found during the same resiliency as rubber, will be found during the substance will be produced At the same time, the development of the car has been along lines that are along the same than the same time, the development of the car has been along lines that are highly favorable to the life of the tire, for both the weight and the horse-power have been greatly reduced Morcover, the swrage owher is beginning to underbrake, in avoiding rough places on the road and in alowing down at curves, will add from fifty to one hundred per cent to the life of the tires.

The tendency toward standardization is even mormarked this year than last, and the fresk car is con spiceous by its absence. The predominance of the four-yillader motor would indicate that this is to be the prevailing type of the future. The six-yillader motor to being made, but in spile of its acknowledged advantages of more even torque etc., it is mainly confined to expensive cars of high power. An encouraging feature, based upon thoroughly sound mechanics, is the increased length of stroke, two of the leading makers exhibiting. 30-home-nower cars with cylinders 3½ inches by 5 inches stroke and 3½, inches by 5 inches stroke respectively.

Indoubredly, the present flood tide of prosperity in the automobile industry is due, largely to the fact that e multitude of people of moderate means, who have been waiting until a thoroughly serviceable are emtoded in the latter of the people of the people of the bookers of the latter of the people of the people of the Beveal makers are offering a four-cylinder Shlorsepower car having all the features of stylish deelag, accessibility to the parts, and ease and certainty of control, of the more centry designs for the low price of \$150. Cars of this type have proved during the past year that with judicious handling they are perfectly of \$100. The people of the people of the people of the year that with judicious handling they are perfectly of \$100. The four-cylinder, four-cylinder, with variations in the valve arrangements to suit the faster of the various buttlers has be come the standard type, and the indications are that uttimately the cylinders of the various buttlers has become the standard type, and the indications are that uttimately the cylinders will be cast or \$100. Transhark hall bearings have given place to bubblity parallel bearings of therein area, although a few first class makers are using a modified bubble of the standard practice.

seems to be established as to utanaster practice. There is a practically universal use of high-tension ignition. All machines down to the lowest periods, or magnetic with either a dual system of ignition. The phast drive is a almost exculsive use, the chain being reteriors of the state of t

Lubrication is effected mainly by two systems, one

emploring "uplash" lubrication, in which the exasts base strongs a bath of oil contained in the bottom of the resik case, and the other employing a trough and pump, which cases a constant and positive circulation through every bearing. Outside of a tendency to clarage the size there are so notable changes in the valve mechanism of American cars, and it is rather remarkable that, in spite of the increased use which is being made abroad of the sited valve (a distinctly American invention), there seems to be no disposition to develop this type in the land of its birth Atthough the multiple-disk ruleth bids fair to be-

Although the multiple-disk clutch bids fair to become the exclusive type abroad, the familiar, leathercovered once clutch has rendered such exercilent servtee on American machines that it still holds its own, and this in spite of the fact that the multiple-disk type has been giving good results on such American cars agare, then

as carry them
In the manufacture of car bodies, there is a marked
tendency toward the adoption of stratight line designs.

The question of the relative advantages of the righthand and left hand drive is coming to the front, and some makers are offering cars with steering wheel placed at the left of the car. Unquestionably the righthand position is preferable in those foreign countries and the composition of the relative terms and possing in the opposition of our own. The composition of our own passes to the left, and the driver, if seated on the right of the car, is in a two-mobe position for judging of the necessary clearance. In this country, where the rule of the road is neversed, it would seen logical also to

reverse also the position of the driver. The handsome display of moot trucks forms perhaps the most notable feature of this year's exhibition, no less than seventeen different makes of commercial motor vehicles being above at the Grand Central Pal according to the commercial motor vehicles being above at the Grand Central Pal according to the control of the contro

INFROVED QUALITY TREAST FRIGH REPOYING.

IVE years age or more, when a man pedd \$2,000 for a touring car, or \$600 to \$1,000 for a runabout, he scarrely expected and or \$1,500 for a runabout for a runabout for an externed a composite from the tent was a received a subject to the state of the

driving axles, and other vital parts. Conditions are very different in the present state of automobile development, when it becomes a matter of surprise to ever well-opered observers that eight out of thirty cars taking part lin the Glidden tour of 1906 should finish an arthouse trip of 3.540 miles run between Detroit, Chicage, Minosepoles, St. Louis, Destroit and Kanasa City in different supar at an average open of twenty miles as hours during the daylight resulting periods, without suffering a shaging inavolutary stop periods, without suffering a shaging inavolutary stop

for repairs, or for adjustments of may subt, so, the way except to brakes, carboreter, this ignition systems, and three. Considering the road and wealther confitions under which the work was deem and the last; of daily inspection, cleaning, and adjusting, this probably proposent as higher degree or defining and partyriance than can be shown for any other mechanical construction.

The wonderful improvement in montrear quality made evident by the results of this test and by a comparison of the specifications of the machines of today with these of machines esting at about the same prices in the early part of the decade now drawing to a close, as due to a number of contributing to a close, as due to a number of contributing to a close, as due to a number of contributing view of special grades of steel, bronze, aluminium, and babbitt having certain definite physical properties satind particularly to the requirements in different parts of the automobile The manufacture of finitions of the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was practically impossible until the them to the country was a compared to the country of the part of the country was a compared to the country of the physical properties of chrome-nicked models and vanished and vanished properties of chrome-nicked steel and vanished modern properties of chrome-nicked to work them.

Before the special alloy steels were brought out, the motor-ar manufacturers nearly reached the end of their resources in the effort to produce safe, durable care of satisfactory power and speed without excessive weight. The transformation that has been wrought in an out uncommon for specially treated chromosomer of the not uncommon for specially treated chromosomer of more than 200,000 pounds per square inch as compared with 50,000 pounds treatle strength of special prior of a quality used by wagon makers and also employed for certain purposes in automobiles. That of the special products and low-carbon of suspecial products of the special products and treason and interpretation of suspecial products of the special products of the special products of the special products of the special products and attreason, and how-carbon to discuss the special products and attreason, and throw the shafter and general out of allignances, and throw the shafter and general out of allignances, and throw the shafter and general out of allignances.

shard and gearn out of signment.

As a result of the employment of steel of such wonderful strength in the slitting-ear sets, by way of 11
unretuce, it is now pessible to trushment the 60 and 60
unretuce, it is now pessible to trushment the 60 and 60
and lighter gars sets than were used in care of 12,
b, and 20 borse-power five years ago, and that with
much greater certainty against breakage and the
practical climitation of the mangling of the ends of
the teeth by meshing and of wear due to contact under
the first of the machine that must sustain heavy torsionals
trease, frequent and heavy impact, or much friction,
the designer has been enabled to keep down the weight
while constantly increasing the strength and life of
the machine as a whole. This accounts for the great
speed, power, quick acceleration, perfect manageshilly, and the degendability and durability of the
chaines of a quarter or third the power and half the
speed, built during the first half of the deende
All this improvement in quality, plus stiffnitsity more

speed, built during the flyst half of the deemde All this imprevenent in quality, plus infinitely more grace in general lines and in comfort to by passengers, and a complete equipment of footing top, pind shield, head lights, magnete, and other aupeaters fittings, its offered to the layer shinos, as no avanues in cost over the ungalaty, unconstraints, and poorty-equipped care of six and overs years, ago.

#### ENGINEERING.

The Jungites retirway, which has formed the subprogress. About 130 men are engaged on the tunnel between Eismer station, 10,445 feet, and the Jungitess John, 1,406 feet above the sea level. The present indications are that the read will be completed toward the class of sett was

At the last meeting of the American Society of Naval Architects and Martine Engineers. In a paper on "Applications of Electricity to the Propulsion of Naval Vessals," If W. L. E. Emmett estimated the efficiency of the turbo-electric installation at 92 per cent, and be, at least, is of the opinion that no other form of speed reduction between turbine and propeller can be made to above qual efficiency.

In a recent article in one of the magnines, Admiral Evans takes a rather pessimistic view of the Internation of the Panama Canal He sees but little revenue in proposet, and apparently he holds the view that, unless the canal be declared free to all nevigation, it will succeed in attracting but a limited amount of abuse of the position that it cannot possibly charge a sufficient toil, at iteast during the early years of its operation, to pay the heavy fixed and operating charges.

A prise of \$5,000 has been offered in Engiand for a twenty four-hour aeroplam motor I aweight into twenty four-hour aeroplam motor. I aweight into gine must not exceed \$46 pounds, and it must develope to not less than 35 brake horse-power. The points who considered in making the award will be weight, further consumption, reliability, were of working possessing as security against fire, and minimum air resistances. The conditions are severe, but unquestionably motor is the weak point in the aeroplane at the present stage of its development.

Emphasite revilinony to the ability of relatored concrete to resid suchtapake above, is given by the coperts who were sent by the Japanese to Mension. The buildings that had been constructed of armoredconcrete, according to Prof. Amore, proved to behighly resistant, and mush significance was attached to the case of two reservoirs of considerable size, one of brick and the other of relatored concrete. The concrete structure received no Injury, whereas the prick reservoir was completely destroyed.

Recently gathered atoms turbine statistics, referring to the growth of this new type of eighte in the transition of the growth of this new type of eighte in was equipped with turbines as eccently as 1001 there are now kirty four vessels carrying this equipment of the aggregate home-power represented being 600,001 it is estimated that because of the lower pressure which can be used with the turbine, no less than 120 tons of weight was saved in the boiler room of the largest of the turbine propelled liners

Basislates published by the Interestate Commerce Commission show that during two years, out of 152 preventable collisions and devaluments, twosty-one of the accidents were due to the fallure of the locomotive engineers to observe the signals. Evidently the human element enters harpely into the question of the efficiency of block signaling. In view of this fact, it is encouracing to note the steady growth of automatic stop devices which, in case of failure of the engineer to the properties of the control of the properties of the control of the control of the control of the properties of the control of the control

With a view to guarding the safety of passengers and preserving the life of rails and rolling stock, the Chicago, Milweakee, and Puget Sound Railway will refrain from running high-spec trains over the new roadbed until it has had time to become thorough? to compected and a reasonable amount of stone or grave ballant has been tamped beneath the ties it takes place, and, agart from the relate of operation, the running of fast heavy trains over new track entails coutly sort in runawals and updeep

Any one who was familiar with the appearance of the Niagars Palls before the present power installations were built and opened, can settle the question as to whether the appearance of the falls has been affected, by the simple expedient, of going to see for install famili though the total amount of water taken for power purposes, in proportion to the total federate to cause the shallower persons of the overflow at the edges of the falls to become entirely dry, thereby greatly reducing the total insight of the crees there

#### ELECTRICAL

A recent pross report states that a chain of wireless stations is to be established by the British Admirally in the Pacific Cosm. High-power stations will be placed at Sydney, Doubtless Bay, New Zealand, Sawa, the capital of the Fiji group, and Ocean island with medium-powered stations in the New Hobrides and Soloman islands

A saw dovice for connecting wires has just been put on the market it consists of a slewer adaption it over the wires, which is filled with a requisite amount of solder. The slewer is furnished with material which when ignited produces sufficient heat to melt the solder. The wires are then jammed together within the allows and firmly soldered in this position. The device radium should be a soldered in this position the device quires no torshor or soldering from, as the inflammable material can be ignited with a match. The advantages of such a system of connecting wires will be specially those who have tried to solder joints on overhead lines.

The voltage on power transmission lines has been study! Increasing, and at such a pare as to almost take one's breath a way. This development has required a similar advance in the design of transform est capable of laking the high-tension current and reducing it to a lower and more service-size voltage at the polita of distribution. The latest transform of the stype have a capacity of 37,30 kilovatias, of the stype have a capacity of 37,30 kilovatias, and capable of taking a maximum voltage of 113,800 and reading it to 12,100. Those transformers have been built for the Stanishaus Power Company of California Each transformer unit weights about 28 tons complete stands 17 feet high, and occupies in floor space of 5% to 15% or the stanishaus power has not appeared 5% to 15% or the stanishaus power Company of California Each transformer unit weights about 28 tons complete stands 17 feet high, and occupies in floor space of 5% to 15% or 15

For the past three years must has been cured by the intrivity in much less time than was required by the old method. The must is pilered in large wooder tanks and covered with the ordinary pikkle. An alter nating current of 35 amperes at 35 voits is passed through the vat, the alternations serving to prevent electrochemical action. Carbon electrodes are used, which are surrounded by province cups that dip into the brins. The coat of curing a vat full of must flow which are surrounded by province cups that dip into the brins. The coat of curing a vat full of must flow of the current is not perfectly understood but if appears to drive the pickle into the must and hasten cure. It also superar to preserve the pickle and pravent its distribution, except for the loss of in gredents taken up by the must

According to La Lamiero Electrique a new microphose has been constructed by Mesens. Carl Eneme and J. Kannar, of Holmstroem, Sweden, which will with stand a current of ten to fifteen anypere. The details of the instrument are not given out, owing to the fact that it has not yet been proticed by patients. The Swedish government rescutly connected several telephone lines, forming a line nearly insterent unsite wery clearly over that circuit, whereas with the of very clearly over that circuit, whereas with the of the control of the conversation has been curried on over a distance of 12 miles, using a high frequency current of six numpers

The Nerry Experience in civing its carnet support to the bill introduced by Mr. Roberta, who is a men too amateur wireless the property of the property of the control amateur wireless telegraphy. Mr. Roberta s measure calls for a board consisting of seven members, one expert each from the Nary, War, and Tressure telegraphy and telephone interests, and on scientist who is well versed in wireless telegraphy and telephone interests, and on scientist who is well versed in wireless telegraphy and telephone to the operations of the annateur telegraphers be confined to certain hours of the day, and that each operator be required to take out a license. The Nary Department has recently for warded to Mr. Roberts extract from the logs of errence cutters, showing some of the difficulties within axial which axial which as openious have to contend.

With characteristic thoroughness the Pressian Government Railway have been investigating the best readbed for their lines, also the best trulley systems and motors. About 30 miles from Berlin is an oval shaped experimental valiway of about a mile in length Part of the readbed consists of wooden ties, and an other part of metal ties. Various kinds of ballast are used, and various methods of connecting the rails and ties. Over this experimental railway an electric trail is operated every weeking for about sweaty hours of the day, and in this way it is possible to determine which form of readbed will best stand the wear of actual service. The overhead system has been changed from time to time, and did stand the wear of actual service. The overhead system has been changed have been used. The overhead system has been changed that the stand the wear of actual service. ### THE MOTOR CAR AND THE ROAD.

THE DESTRUCTIVE EFFECT OF HIGH SPEED.

BY LOGAN WALLER PAGE

DIRECTOR OF THE OFFICE OF PUBLIC ROADS, UNITED STATES DEPARTMENT OF AGRICULTURE.

The most serious and difficult problem now compatine the attention of highway engineers all over the world is the preservation of the crushed stone road under the destructure action of motor vehicles, and the deviating of new methods of construction adapted to the requirements of this twentieth, ensuring trade. That the automable has transitionally no one with contraction of the United States, and the number is

and the fron-tired wheels passing over the road from time to time were depended upon tow are of a sufficient amount of rock dust to replace that carried away by whol and water, and this, under the action of moleture, recommend, thereby automatically renewing the bond of the road surface. When the road was subjected to drough, the conditions were made normal by regular aprinkling. With the advent of the automable, a totally new condition pressis. The rubberble, a totally new condition pressis. The rubberthe effect were produced by suction or vacuum, the action of both front and rear wheels should be somewhat similar at least. It seems apparent to the writer, therefore, that the read best adapted to motor traffic in the road which will best resist this powerful tractive shear. It has already been demonstrated that no plain meandam road fa capable of resisting this vacuum of the plain meandam road fa capable of resisting this forestime.

While the destruction of the road may be considered as the most tangible and serious problem, the dust

Twenty miles an hour.

irty miles an hour

THE DISINTEGRATISG RYPECT OF AN AUTOMOBILE TRAVELING OF AN ORDINARY MACADAM ROAD AT DIFFERENT SPEEDS.

increasing at a marvelous rate. In Prance, which is credited with shwing the most superb system of roads in the world, built at a cost of about \$825,000000, a great International Road Congress was sanctioned by the Pranch government and held at Paris in October, 1988. Bo alarming were the ravage extuned by motor pose of the meeting was announced to be "The Adaption of Roads to Modern Methods of Loosomician" in the United States, the problem as yet is a vital one only near the great venture of population, for the resont that but a small percentage of the total mineage or reads its improved, and the motor tradic is largely concade in improved, and the motor tradic is largely conceasing use of the automobile of the successing was of the automobile.

The fact that must give us concern is that the old methods of construction which have stood every test for more than a hundred years are inadequate to most the conditions of this new form of traffic, and that we are in the midst of a transition period which may exentually revolutionize the science and art of the road eventually revolutionize the science and art of the road what is to be expected as the property of the road what is the exact cause of the injury, and finally to devise an adequate remedy
Whese Trèsucyct, the great Prench esgineer, made his

When Treasquet, the great French engineer, made his report to the Council of Bridges and Roads in 1716, he set forth the principles of construction which, as modified and added to by John L. MacAdam in the early part of the nineteenth century. These proven adequate until the twentisth century. These great road capable of withstanding the wear of iron-tired horse-frawa vahicles, for the motor-driven vehicle had no place in their philosophy. They worked upon the theory that the dust abraded from the crushed stone would full the voids between the angular fragments and when set would serve as a cement, thereby making the road surface practically a monolith. The tron-shot horses

tired whosls moving at accessive speed fall to predoce any new dust from the rock, but the tremendous abserring effect of the driving wheels forces the loose dust on the road fato the air in great clouds, and, as the body of the machine displaces a large volume of air, the deflected currents carry the rock dust off the road, thereby effecting a permanent loss of the air, the contract of the cont

Highway and mechanical engineers have given much study to the action of the automobile on the road surface, and many ingentious theories have been advanced. While it is true that the slipping of the tire, the skidding, the shape of the car body, and the succioes of the peacematic tires all contribute to produce the effect, the most conclusive experiments seem to warrant the assertion that the great tractive force or nhear courted by the driving wheals of motor cars is the main factor tollury a Areire of itself conducted by the United of their of the contribute of

nuisance as intensified by motor traffic is most farreaching in its indirect effect. It has been claimed that intertential the intertent of the dust produced by man comes from streets and highways and someone has very apity termed the public road the "national dust factory." The effect of the hage clouds of dust upon health must be very great, as most forms of disease to cross growing adjacent to the public highway through the dust nuisance is real and tangible, and particularly is this true of small fruits. So extreme has this condition become in certain districts that no attempt is made to raise fruit near dusty roads. Its effect upon some classes of live stock is most severe, cuttle and horses in particular being susceptible to the germs of tuberculosis carried by the dust. The authmobilic cannot be half responsible for these forms of mobile cannot be half responsible for these forms of treatment which might be considered a pallistive.

treatment which might be considered a pallative. The efforts of progressive bighway engineers are directed, therefore, primarily toward the preservation of ourcor stone-surfaced roads and the construction of dustions of the effect of the effect of the effect of the the dust nuisance. The results so he occupantly the there is no effect of the effect of the effect of the there is no effect of the effect of the effect of the state of the effect of the effect of the effect of the state of the effect of the effect of the effect of the state of the effect of the effect of the effect of the state of the effect of the effect of the effect of the state of the effect of the effect of the effect of the effect of the state of the effect of the effect of the effect of the effect of the state of the effect of t

It is evident from even the slightest consideration of the subject that the solution of the problem must come, for the most part, from the highway engineer rather than the autonosible manufacturer and the legislator Manufacturers have, to some extent, tried to reduce the dust crasking tosseem, of their machines by various mechanical devices. Experiments in Engiand Prought out the fact that care raided with bottles having the contract of the contract of the contract of dust than those with an average clearance. ### MOTOR BALLOON GUNS.

AUTOMOBILE VS. AIRSHIP

It is to their credit that the manufacturers of arfillery should so earnestly have grappled with the new probl problems presented by the development of successful aeroplane and dirigible balloons and so quickly have designed special ordinance to meet the new form of warfare. The firm which has been most active in this direction is the great Krupp Company, in having brought out several types of gun, capable of firing at the high angles which will be necessary in order to hit the rapidly moving airships and planes of the future. Because of the extreme mobility of the new

method of attack from the sury that the means adopted to resist it shall be capable of a correspond ing mobility This is especially true where the warfare is likely to be car ried on against more or less rapidly moving bodies

Now the automobile be ause of its speed weight, and strength, is particu larly adapted, not only for carrying light automatic guns but for affording a platform from which they my be fired with a res sonable degree of ac-curacy Indeed the artilmotor (ar armorlery plated and carrying a gun that is locked firmly to its chassis, is the natural counterpart of the familiar armored train run ning on the rails of the

regular steam railroad And although the military automobile will be largely restricted to the reads, and will leave them only under exceptional conditions of amooth and fairly level country, the automobile balon gun will find a field of usefulness in future cam-

paigns whose limits can only be determined by the hard experiences of a regular campaign. Of the three rapid firegum motor cars herewith shown, one is American and the other two are of German make One of our illustrations shows a rapid fire balloon gun, mounted on an armored motor car of 60 horse-power. The latter, in spite of its weight of three and a quarter tons, is capable of making a speed of 45 kilometers per hour and mounting grades of 22 per cent, even when the roads are of poor quality The gun is also shown mounted on a semi-armored can This effective weapon has a muszle energy of 248 This emetities weapon has a music energy or 24% meter ions and an extreme range at an angle of 48 degrees of 7,800 meters. At the maximum elevation of the gun, the shell has a maximum height of trajectory of 7,800 meters.

oring of the motor cars consists of nickel steel plates, 3 millimeters in thickness, and the gun itself is provided with a special shield capable of a wide are of aiming The wheels, also, are con

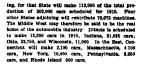

in with nicket steel plating The ammunition ۱. carried in a box underneath the will be noted that the front of the car is provided with silts for

The guns are provided with shells of a special design, suit ing the gas bag of a dirigible or the canvas or rubber-cloth cov ered surfaces of an aeroplane To the flight of the shells, they are furnished, at the base, with a smoke - producing anterance which

instant of firing the gun, and emits a distinct trail of amoke during the flight of the shell. This gives the gunner some indication of the error in his sighting. But it will be a very difficult matter to score upon

a fast flying machine speeding mile-high above the earth. The most promising form of attack is with mel, which, if burst at the right distance in front of the object, will envelop it in a perfect spray of jagged shell fragments

Another illustration shows the McClean matic rapid-fire gun, as mounted on a 3-ton Packard

These figures are taken from statistics obtainable

in connection with eighty of the prominent auto-mobile companies, and are startling to may the least, both as to their bearing on the location of the motor car industry, and or the importance of the au tomobile industry as a whole In addition, it whole In addition, it must be remembered that there are fifty other firms making 100 cars or less with 150 makers turn ing out a few cars or experimenting

Just why the middle West should lead in motor car manufacture is worthy of some consideration, especially when it is re-membered that much of the early experimenting in motor cars and early manufacturing was done at plants in Buffalo and Tarrytown, N Y, Ma

N J, Bridgeport and Hart ford, Conn , Philadelphia, Pa , and other Eastern States. Because of the tremendous growth of the industry in the past tet years, and the amount of capital and num ber of people employed, the settlement of an industry like that of automobile making in any particular sec-tion of the country, is a condition worthy of thought. The middle West may be said to be in control of the situation, not alone in the making of cars, but in the making of tires, parts, and accessories. For this condition, we must first give credit to the industrial enter-prise of the middle West, for the securing of big facprise or the middle west, for the securing of big fac-tories, for the enterprising methods of its boards of trade, and for the readiness to contribute money toward the securing of new industrial enterprises, like that of motor-car building. Next must be considered the labor situation, which is excellent in the middle st, especially in the matter of hands for automatic machinery Most of the big machinery making com-panies are in Ohio or Indiana, where machinists of excellent character are to be had in large numbers.

sides being the center of the machinery trade, the Besides being the center of the machinery trace, the middle West has been the headquarters for raw ma-terial to a very large extent, at least after it has been put through its first or second precess, as in the case of rubber, steel, leather wood, brass, and other things

used in the mod

ern motor car More important than all is dle West is the center for transportation, a most important it s m when the matter of freight on au tomobiles is con sidered. Because of their high value, automobiles contribute very henvily to the and the matter of freight care for an extre on means an add of cost, which ev-ery manufacturer tries, to avoid. While it is true (Continued on

truck, for tests which were carried out inst year at Cleveland, Ohio. Lieut-Coi O W Lissack, of the Ordnance Department of the United States army, and McClean, designer of the gun, had charge of the tests, being assisted by the Standard Automobile Company, the Cleveland dealer cars and trucks.

The gun fired 3-pound shots at the rate of 100 p minute, the range being 35, miles. Shots were tried with the brakes of the car set, and also released When the brakes were set the truck did not move, and when the brakes were set the truck and not move, and no shock was felt by those surrounding the gun on the truck platform. With the brakes released there was a slight movement on the recoil, but no shock. The designer of the gun recommends its use on a truck such as the Packard, but armored for war

We hope to publish additional information regarding the results of additional trials of this gun, which are being made at Sandy Hook and Springfield for the army, and at Indian Head for the navy

they are difficult of enforce sent and are punitive they are difficult of enforcement and are punitive righter than preventive, applying the punishment after the evil has been committed. The abuse of automo-biles as distinguished from their proper and most de-strable use has reached such perious proportions as to call for the general application of machanical and autocall for the general application of machanical and auto-matic means whereby the unauthorised use of a ma-chine can be positively prevented or detected the first, time it occurs and the punishment made to follow, swiftly upon its commission

inventure have wrestled with this problem for several years, and a variety of devices have been put on the market to fulfill the desired ends. The difficulties

### WHAT THE MOTOR VEHICLE IS DOING FOR THE FARMER.

BY WALTER LANGFORD

Less than five years ago farmers generally looked upon the automobile with bitterness and condemned it as a "toy of the rich" Today, there are farms com prising hundreds and even thousands of acres, on which nearly all of the heaviest work is done by motor vehicles. There is hardly any part of farm work that cannot be done more quickly and with greater satisluxury and time-saving ability of the motor car He balances off the cost of a tenth or a twentieth of a gallon of gasoline per mile traveled against a third or gamin of gasonine per mile traveled against a titlet of half bushel of outs a day at 65 cents a bushel, whether the horse is working or is standing in the stall on a rainy or a winter day, and reckons the time saved to himself as mainly pure gain reau, high clearance above the road, a theroughly pro-tected engine and transmission, reasonable price and low fuel consumption and maintenance cost have con-tributed toward making this model popular with the rural buyers. From the statements of hundreds of users, it is found that the average cost of upkeep is than two-thirds that of keeping a horse. The

CARRYING CHATED CRICKERS AND EGGS TO MARKET

faction by the use of motor power-cither applied to a self moving machine or in the stationary form— than with horsefiesh. Whether it is making a quick trip to town with a load of butter, eggs, fruit, or vege-tables, to the creamery with the evenings cans of fresh utils, to church with the family on Habbath morning, doing the spring and fail plowing, cultivat ing, resping threshing—the motor vehicle in its varied forms has become the latest ally of the progressive prosperous farmer

It has been a matter of general knowledge and com mon comment in automobile circles that extraordinary mon comment in automobile circles that extraordinary numbers of motor cars have been going into the ro-note sections of Kansas, Nebrasks, Minnesota, the Dakotas, Colorado, and even Montana Oklahoma, and Tarsas during the past season. The statement has been made by a man identified with the trade and med to be posted that fully one-quarter of the purchases of motor cars west of the Mississippi dur-ing the season of 1909 were made by farmers, and this means a good many when the combined output of the manufacturers of the country for the year ag gregated in the neighborhood of 75,000 machines Bonne of the little communities in the Middle West, with a population numbering only hundreds or at most a few thousand inhabitants have begun to boast of ing more motor cars in proportion to populapeaseasing more motor cars in proportion to popular tion than any other city or town in the country, and to prove it, they congregate all the cars in the village in Main Street and have a group photograph taken. The farmer, who has long distances to go for every-

thing, from a keg of nails to a paper of tobacco, and who works early and late to make up time lost partly in going "to town, has not been slow to appreciate the Scattered all the way from the Atlantic to the Pa-cific coasts there are small 'ruit and vegetable grow-ers, dairy farmers and poultry raisers who make a daily practice of carrying light loads of produce to market in the tonneau or on the rear deck of ordinary light touring cars. They can leave the horses to work in the field and can make the trip in a third or quar-ter of the time formerly consumed thereby gaining just that much additional time to be devoted to more work or to reading visiting, attendance at concerts

The ordinary four or five-passenger touring car of The ordinary four or five-passenger touring, ear of moderate power and reasonable price is most extensively used by farmers. Some of the accompanying illustrations show how such a car is put to practical uses on the farm with the rest next removed. This is the general utility automobile of the agricultural sections and is used for a great variety of purposes within it he farmer drives out to his grain field to experiorated the threshing, runs down to the pasture with a reel of wire to repair the fence, runs into town ded, carries cans of milk to the creamery or crates

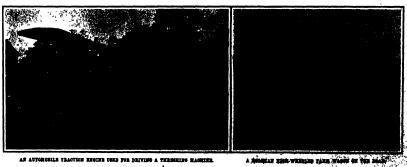

mended, carries cans of milk to the creamery or crates of live positry to the sepress of the control of the con

farmer of to-day is well informed regarding the me chanteal features that adapt an automobile to his re-quirements and is a careful buyer. He can safely carry 500 pounds on the rear of a 20-horse-power car and can drive ten miles to town in from half to three-

and can drive ten miles to town in from half to three-quarters of an hour with the load.
Largely as a rount also of the farmers' demands there has been developed during the last three or four years a type of motor car called the high-wheeled buggy. There are upward of fity companies in the country now actively engaged in building this strict or motor car separatily for use to country datasets where the roads are rough, hilly, and, according to very low in prior, simple in construction and opera-tion, and answer the purposes of many rural dwellers very well. They use only about a galloon of guestion to fifteen or twenty miles traveled, and a set of na-row solid tires, counting say 184, will wear a year or to fitteen of twenty names traveled, and a re-row solid tires, costing say \$25, will wear a year or more with no expense for repair of punctures or blow-

Within a year or two there has be Within a year or two there has been added to the two-passenger runabout and four-passenger surrey models a high-wheel open-bed light delivery wagon model, of the democrat wagon type, especially suited to farmers' use. A lead of 550 to 800 pounds can be carried in the game beneath and bark of the front seat, and its some makes as extra double seat can be set in the back to scommodate extra passengers when the the back to accommodate extra passengers vehicle is to be used as a passenger convayan

vehicle is to be used as a passenger convayance. Other light work wagons with open-bed bodies par-ticularly suited for agricultural uses but fitted with longer bodies and having a load capacity of 1,000 pounds or more and costing \$1,000 and upward, are

AS AUTOMOBILE TRACTION REGINE USED FOR DRIVING A THRESHUSE MACRICIA.

#### Scientific American

manufactured by several companies in Chicago, Syra-cuse, Efgin, III., Dowagiac, Mich., and Littis, Pa. They are excellently suited to carrying to market good sized loads of vegetables, fruit, dairy and barnyard produce weighing from 1,000 to 2,000 pounds, and for hauling back loads of feed, fortilizer, feacing and building materials, farm machinery, and so on The

high wheels give the axiss and drivmechanism a good road clearance, the construction is of a heavy rable as well as simp

Numerous cases might be given of motor cars put to special service in connection with farming. In Maryland there is a high-class dairy farm where motor delivery wagons are used altogether to distribute milk among consumers in the vicinity, and in Indianapolis a large milk company is using a 14-ton and a 3-ton graciine using a 14-con and a s-on gasonne truck in the collection of milk from dairy farms within a radius of twesty-five miles of the city, which was formerly shipped by the interurban electric railways or by horse and wagon. In England a large produce grower sends his fresh vegetables to market in a huge motor van, the roof and tailboard of which, as well as the inside, are piled with green goods These examples seem to foreshadow the time, not very distant, perhaps, when farmers will find it cheaper and more convenient to ship all of their farm products to market on motor trucks than to haul them with horses and wagons. Possibly the trucks will be owned by local express companies organized for the purpose, which will charge a reasonable price for haulage.

so that it will pay the farmer better to keep his horses—if he needs any then—at work in the field, and he will not need to invest any capital in the motor trucks. Doubtless some of the transporting companies will use motor tractors, which will run over regular routes every tractors, which will run over regular routes every morning and pick up a string of farm wagons loaded with produce, hasling them to market and back again for a fixed charge. A single tractor should be able to haul four or five such wagons over good roads. In Connection a three-ion truck is regularly used for hasling grain and carrying all sorts of farm sup-ples and products for a 1,260-eer farm. This is one

for nauling grain and carrying all sorts of farm sup-plies and products for a 1,300-acro farm. This is one of the many fancy estates conducted in the East by wealthy owners largely as a personal hobby yet at the same time as a profitable investment. The truck represents an outlay of \$5,000 and is kept in a spe-cial garage for work motor vehicles which are to be

sed extensively on the farm A ranch of several thousand acres in Montana is conducted entirely without horses, the plowing, sow ing, cultivating, reaping, threehing, and hauling of the grain to the railroad being done by motor tractors and grain to the railroad being done by motor tractors and motor waggons. We have had the horseless sirect car for twenty years, the 'horseless carriage" for ten, and now we have the horseless farm. May we hope some day for the horseless city?

any for the norminess city. While the foregoing examples are isolated cases and apply to farming on an extensive scale with ample capital, they point to great possibilities for the future use of self-propelled vehicles in farm work, utilizing exactine kerosene or densitured alcohol as fuel The farmer with a small acreage who would not be justi fied in buying a motor tractor for his own use, will be able to hire his plowing and threshing done by com-panies operating motor tractors, as for many years he has had his threshing done by itinerant steam threshing outfits. And, incidentally, the work will be done cheaper, there will be no danger of fire from flying sparks, there will be little or no water to haul, and there will be fewer men to feed

In this country, as well as in England and France, there are large companies that make a specialty of

AN AVERY PARM TRUCK HAULING SCRAP.

building small farm tractors for universal tractive and stationary power work A company in Minneapolis makes an 8 horse-power tractor weighing 5 500 pounds for such work as operating hay presses corn shellers etc and for drawing wagnos and portable machines of this class on the road In York Pa. is another large company that makes motor tractors and trac nes in ten sizes, from 1,000 to 35,000 pour in weight. The smallest is rated at 1½ to 2 horse-power and is intended for all sorts of farm work such as hauling the stone-boat, churning pumping feed cutting, etc.

rican motor tractors used for plowing and threshing usually develop from 12 to 35 horse p and weigh from 5 000 to 20 000 pounds They gang plows turning from two to eight furrows gang plows turning from two to eight furrows at a time One of these—a 15-horse-power tractor built by the largest harvesting machinery com-pany in the world—plowed 10% acres of "gumbo soil with a three-furrow 12-inch bottom plow in

an hour and a quarter on a consumption of 1½ gallons of gasoline per acre at an international competition held in Winnipeg last July A "wagon fractor, built in Peoris by a great agricultural implament works for general utility

cents an acre for fuel. In a ten-hour day  $7\frac{1}{2}$  acres could be plowed for about \$3.25, not including labor. This wagon tractor is a very interesting vehicle it was designed particularly for farm purposes by mer who are familiar with the peculiar requirements, an nts, and bines in one machine a truck for carrying load

its own body, a tractor for drawing plows and other farm machinery, and a power plant for driving threshing machines hay balers and other stationary ma chinery by belt It will take the place of several teams and wagons on the farm

Nowadays, on the farm as well as in the manufactory it is necessary to do the largest amount of work in the short est time in order to make an under taking successful. This is recognized e progressive farmer and farm machinery builders and to a large ex-tent the advantages of the motor car and motor tractor are appreciated by builders of farm wagons and bugg Most of the leaders in these fields are now offering their customers a motor buggy, a motor car, a motor wagon, OF 8 motor tractor

#### The Modern Ricciric Antomobile BY MAIN GROENFELDT M S. M.S.

The heavy cumbersome electric cab or broughan of carlier days has cleared the field for the light run-about victoria or interior driven coupé Less weight means more speed and a greater mileage radius it was looked upon as a great per formance when one of the earlier types of electric automobiles traveled forty miles on a single charge of the buttry at a comparatively low speed
The modern electric automobile will
negotiate about twice the distance at
a much greater speed. The most vital components of
an electric automobile are the motor and controller.

two parts which are of different design on about every For its various advantages the serieswound motor has outclessed its livel of the earlier days, the compound motor. The writes wound motor, if properly designed will do its work for three hundred and the first first hundred and the first firs dred and sixty five days in the year without requiring any attention attention. The most desirable motor is not that th tends to drive a car up a hill at a comparatively high speed. A heavy battery discharge is thus en which is of course very detrimental to the bat tery Of two cars traveling at the same speed on the level, that one will travel the faster on a grade whose controller was not changed. The motor of this faster

DROK THE PASTURE PRICE IS OUICELY REPAIRED.

car is designed for a smaller increase of torque in proportion to the decrease of the speed. Even if this difference in speed is speed size it this difference in speed is very small say one-half mile an hour the faster car will have to pay dearly for it in current as well as in decrease of mile age radius and in battery wear The go He will designer will find a middle way strive for the highest battery efficiency

tast electric, as the power is unlimited for a short distance. The art is to apply the power at disposal in the most all-around estiffactory way and to design a carriage which is reliable and cheap to maintain.

In the line of various controllers the drum type for good reasons seems to have grown into great favor The various speed changes can be obtained without arcing or burning, and a gradual increase of speed is effected from step to step with a small increase of (Continued on page 68)

the road, was tested at the same trials. Coupled to a two-furrow 14-inch gang plow, it turned ever 106 acres in 1 hour 25 min-utes on a consumption equivalent to 386 gallons

THE REPTY CARS BROD

s in the field and on

### THE MODERN LOW-PRICED CAR.

#### BY JOSEPH ROGERS.

The automobile buyer faces no such questions in 1910 as confronted him a few years ago, when all that was expected of a car was that it would run. At that was expected of a car was that it would run. At that time the gasoline engine was not understood as the time the gasoline cignite was not understood as the engineer understands it to-day and all of the parts and appurlenances were undergoing a process of evolution that resulted in said differences between the models of two sun cressity years. Each make had some peculiar-ity of dwign, and the actection of a car was compil-cated by the difficulty of getting definite information on performance

There were reliable cars, of course, but their initial There were remove cars, or course, but their initial cost and the supense of operation made their ownership possible only to the very well to-do. The car that could be bought by the man of moderate income re-quired close attention and the adjustments and repairs that were a constant necessity left him little time for anything clse. If these were in the hands of a repair man the monthly bills were out of all proor a repair man me moutary ones over out or an pro-portion to the mileage covered and the pleasure ob-tained. Automobiling at that time was unquestionably a diversion for the rish, and it is popularly supposed that such is still the case, but as a matter of fact, the man of moderate income can to-day pure lasse and use a rar at an exprese that is well within the bounds of

The primary cause for this is found in the relatively close understanding of engine and car design that obtains to-day. The systematic experimental work that has been carried on in the large factories has resulted nas seem tarried on in the large factories has resulted in a refinement in design and an approach to a stand and that place automobile manufacturing on as eco-nomical a basis as is possible in the production of any other mechanism

any other mechanism

The moderate price at which an automobile may be bought is not due to the use of poor material and cheap labor, on the contrary, the low priced car of to-day is better in quality than the highest grade cars. of six years are

in the early days of the automobile industry the manufacturer was under the necessity of making all of the parts, to-day, the factories actually making even 75 per cent of the parts that they use are in small proportion to the number of producers. A few years ago, when a manufacturer purchased his engines, change ced gears or other parts, he concealed the fact, to day, a constantly increasing number of firms make it no secret that their cars are assembled in whole or in part. It is to these changes in policy that the excellence of the medium priced automobile is largely

The manufacturer of a complete car is under the necessity of maintaining an experimental department in which he can try out suggested improvements on all parts of the chassis This is expensive work, and a proportion of the cost of the department must be ina proportion of me cost of the department must be in-cluded in the price of every car sold. The maker of an assembled car is under no such handleap, for each of the firms with which he does business will carry of the firms with which he dows business will carry on only such experimental work as in required for its special line, and the expense is borne by so great an output that the individual proportion is negligible. There was a time when an assembled car was un-

doubtedly open to suspicion, for however desirous makers of its parts might be to do good work they had neither the knowledge nor the facilities that would reake it possible. These same companies now possess normous plants, their designers and equipm the best obtainable, and their products embody the intest and best in practice material and workmanship. Assemblers thus have parts at their command that are of a high degree of excellence, and can buy them at prices that are far below what was charged for the

prices that are tar octow what was charged for the weak and faulty product of former years. The low prices at which assembled cars can profit-ably be sold have forced the builders of cars of com-peting grades to manufacture on a very large scale, in order to bring down costs through economies pos-sible only with quantity production. Such a firm equips its factory with jigs and special tools for every no order that calls for even a slight deviation from he standard specifications.

When a manufacturer turns out twenty thousand

cars a year, it is not only justifiable but n him to invest very considerable sums in special mahim to lawed very considerable sums in special ma-chiery of all kinds that for a smaller output would be inadvisable One manufacturer has spent \$46,000 for diss to produce a rear acts tousing, on a produc-tion of one thousand ears, the charge against cach for this would be \$400. With an output of twenty thou-and cars, however, but be charge of \$3 against each is little stought for the purchaser to pay for so excellent

A recent development that illustrates the dideavor

to reduce manufacturing costs is the establishment by some of the leading producers of assembling shops at the large centers. To these are shipped parts in suffi cient quantity to build the cars required for that locent quantity to build the cars required roy tast io-cality, and as there is no equipment of machine tools, the expense is slight. The freight rate on unassem-bled parts is much lower than on complete cars, and the saving effected in time and convenience as well as

in money makes the system a satisfactory one However it may have been in the past the present day manufacturer of moderate-priced cars makes no e than a legitimate profit ducers stated recently that his profit on a \$1,000 car is less than \$100, this is not excessive when one con-siders his cormous investment in material and parts, his really vast equipment of machine tools, and his labor expense

It has been said that any average engineer can de sign a car to sell at \$4 000, but that the greatest skill and a car to see at \$ 9000, but that the gracest skin is necessary when the selling price is to be less than \$1000. However that may be, the medium and low priced cars on the market show exceedingly clover designing and bear every indication of the highest grade of mechanical engineering Being light in weight, the material entering into their construction is selected with the greatest care, and it is typical of the automobile industry that many of the alloy steels in common use were hardly more than laboratory curl

The whole tendency of design is to reduce weight and machinery and assembling costs, but it is rare to see a case where strength and durability have been sacrificed for economy. One of the features of the sacrificed for economy One of the features of the e, which results in a considerable saving in weight and cost, with no apparent reduction in strength or ability The increasing tendency to adopt the gravity system of water circulation is another economical move, for it permits the suppression of the pump. The mechanical lubricators that were formerly in general use have been abandoned in favor of a single pump located in the crank case which is not only less ex pensive to build and assemble, but makes lubrication as positive and unfailing as it well can be. The mag neto is now the standard equipment even for cars of neto is now the standard equipment even for care of very low price, and quite frequently it is the sole means of ignition. An advantage that may be gained through its use is that the spark may be maintained at a fixed point, and therefore the spark control lever and its connections may be done away with. The locating of the clutch and brake pedals on the gear car duces the cost of assembling, for when they are hung on a rod passing across the frame as was the practice in former years, accurate fitting is an absolute and costly necessity When the engine, thange speed gear and rear axle are soparate units, assembling is com-plicated by the necessity for setting them accurately in line, in a great number of 1910 cars the change speed gear is either built in with the engine or the rear axie, and the cost of assembling is reduced in conse-

In spite of the excellence of the 1910 cars, it must not be assumed that the limit of perfection has been not be assumed that the limit of perfection has been reached Some of the work turned out by the de-signers shows that they have followed a common path, but in many cases there are differences that are not easy to reconcile. The perfected car cannot come until the sflectory of one definite construction has been recognized, and its proper proportions domo-strated. The great versions in the designs of belay is evidence in itself that there is still much to bears, is evidence in itself that there is still nuch to learn, for otherwise, as an example, there would be less difference in the dimensions of engine bearings than in now noticeable in different makes of engines of the same power. The relation of bore to stroke is the subject of a vast difference of spints on it the present time, and even the relative length of the connecting roll by no mean fixed

rod so by no means nixed.

Having produced cars that will run, and that can
be depended on for steady service, the problems now
before the designer have to do with the increase of ef-

before the designer have to do with the increase of efficiency and cromony of operation. At the present time it is doubtful if any manufacturer knews what proportion of the power of his engine is abserbed in operating the valves, or is driving the magnate and pump. But there and other him more complicated dispution, but there and other him more complicated dispution, the context of the present engine are adhered in the context of the present engine are adhered in the context of the context of the context of the features and relative dimensions that survive the ordered or usage. For the car center this will make a reason of the features and relative dimensions that survive the ordered or usage. For the car center this will make a reason of the features of the feature of the fe

The Wright suit and Aviation in America.
The granting last week by Judge Hasel of a prelimi-nary injunction restraining Glenn Curties and the Her-ring-Gututes Company from making, selling, or flying their well-known type of biplane has quite taken by surprise almost everyone versed in patent law, as such an injunction has been granted very rarely, if ever before upon an unadjudicated patent. Even in the case of the Selden patent covering the use of a clutch between the motor and the road wheels of an autobetween the motor and the road wheels of an auto-motition— one in which an infringement was much more apparent—such an injunction was not granular. The granting of the higuerion at this time has had two results in the first place it has intimidated a good many inventors who were hard at work upon the per-fecting of the aeroplane, and secondly it has ercour-aged the Wrights to attempt the creation of a monopoly in flying machines. With a million-dollar company back of them, and with orders already booked aggregating more than this figure, the granting of the p ent injunction gives them practical control of aviation in America. A second step in this direction occurred on January ith, when aviator Paulhan was served with a notice to appear in the New York District Court ten days later to show cause why he should not be enjoined from flying his Farman biple the United States. As ne is booked to make flights at the Los Angeles aviation meeting from the 10th to the 20th, this action may be a serious blow to the first actation meet held in this country The death of Leon Delagrange from a fall sustained

The death of Leon Designange from a rail sustained as a result of the breaking of a wing of his Bleriot monoplane while flying in a 20-mile wind at Pau, France, on the 4th inst, has given aviation another setback that it will take a long time and many excellent demonstrations to overcome Four lives lost with in the last four months is a record by no means encouraging to sportsmen, and unless overything possi-ble is done to encourage flight in this country, none of the aeroplane factories soon to be started will do much business for some time to come

Hydrogen for Infining Pneumatic Tires. The inflation of an automobile tire with a hand The inflation of an automoone thre with a minus pump is so laborious an operation that some sufficient mobilists carry cylinders of compressed sir, with which a tire can be inflated easily and rapidly. The which a tire can be inflated easily and rapidly. The cylinders, however, may be found empty when they are most needed. Drouctly a French manufacturer of aluminium paper, has conceived the idea of replacing the air by hydrogen, generated by the action of water on specially prepared aluminium waste. In presence of alkalies, aluminium decomposes water into oxygen or ankalies, aluminium decomposes water into oxygen and hydrogen. The oxygen combines with the alum inium and the hydrogen is set free. The method of operation is very simple. About 10 ounces of granu lated aluminium and 10 ounces of water are introduced. lated aluminium and 10 ounces of water are introduced into an air tube of the expactly, 15% plats which is the air tube of the cyactly, 15% plats when the bronse plug is quickly screwed down in a wessecond the space not otherwise occupied, about 5½ pluts, is illude with hydrogen at a pressure pluts, is made and the pluts of the pluts, is made and the pluts of the pluts, is considered to more than 100 other product of the reaction is alumina, which can easily be washed out. The special preparation classified with the adultious consists in the addition of a small per-cutant of mercury behindred which starts the reactions. centage of mercury bichloride which starts the reaction in the absence of sikelies so that pure water can be

employed.
This method possesses two advantages. It allows
overy automobilist to recharge his air tubes without
returning them to the factory. There is also a real
advantage in infasting tires with hydrogen instead of
air. The diffusion of gases through colloidst substances like India rubber follows a very different kee
from that which governs the diffusion of gases through from that which governs the diffusion of gases through prorous walls. In the latter case the rate of diffusion is inversely proportional to the square root of the deastly of the gas, but the rate of diffusion that had been successful to the section of the deastly of the gas, but the rate of diffusion to the section with which the gas can be luquided Bytpogen generated by the action of aluminism upon water was used for filling balloons in the Rosso-Japanese war, but this imperious and simple method of obtaining orginators of compressed hydrogen appears to be as new as it is interesting.

To Americans who are accessfound to Breezel car folog, it will be surprising to learn, on the accharge of The Euglanger, of London, that lear topich there will ignaturated an electric-car service from size at the London subway (table surface so the selectric of North Thoubley, on which a fare of held a cept will be chieged.

### OVERHAULA CAR.

BY HERBERT L TOWLE

In order of importance, the Relilities needed for everhaling are a warm, light place to work, an exten-sions electric light, a bench, several boxes for use promptings and supports for the dismantled parts, and is there! an assortment of tools as the owner's means will permit. An iron vise, a bench drill, a foot or win pecent. An ion vase, a clean urin; a not or power liftle for metal work, and an emery wheel are almost necessary. Falling these, certain parts can be sent to the about refitting A complete kit of bench tools is simumed—hammers, siles, hack saw, chiesia, wreachs, serswdrivers, cotter pin extractor, etc.; also

oncing according to the state of the state o the souther and sixts and greasy drop them into a pan of Brosens Have & Brige box handy for small parts, and three or four shall box es in M: for the purpose of group-ing religible small parts together It is very easy to get a car apart and shuffe the various belts, wash-ers, said other small things so thoroughly that it is impossible to tail where they er on reas embitng Apportain by

looking under neath whether the gasoline tank in attached to the body or to the chassis. If the

former, disconnect the gasoline pipe at ooth ends, plug the ends with bits of rag, disconnect the horn tube and any electric wiring that may run from the body to the chamis, take out the bolts hold-ing the body to the side and rear frame mem bers, and lift the body straight up The dash is a part of the chassis, not of the body, and does not need to be disturbed as this stage Have a couple of wood horses ready to receive the body Do not set it on the floor, as there may be parts projecting beneath it such as the ath the tank.

no amateur is advised to begin overhauling in the order of ease rather than of magnitude. For this reason the brakes are suggested as a start. Ingested as a start. In-sed rear brakes on a with side chains are rally exposed by taking of the rear wheels. Pirst see if the brake Remove the radiator, wash it out under a strong stream of water, and if it is suspected of being encrusted with scale fill it up with kerosene and let it until spring time will do no harm When reassembling it is important to give the radiator an even bearing around all four stude, supposing it to be held down by that number If possible, have it rest on 44-inch sheets of rubber, and do not draw the hold ing-down boits entirely tight. The radiator although frail, is much more rigid than the frame, and any apringing of the latter will surely start leaks in the radiator if it has to follow it. The two sketches Fire

1 and 2, show how a frame may be racked in going order a rough road. If the radiator leaks it is best to let an expert tinamith repair it (not all insmittles are expert). The secret of success is to use a good grade of solder and sweat it thoroughly into the seams taking plenty of time. If the top is not steaded it will be worth while to run a brace or stay rod to it from the top of the engine or the dashboard. This rod need be only heavy enough to check the vibration If there is much lost motion in the worm or o

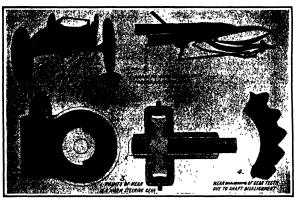

reducing gear of the steering mechanism disconnect the steering links also the throttle and spark con

nections and take the steering col reducing gear at fts base Open the casing and see where the lost motion is It may be in the threads of the worm A Fig 3, and the teeth of the segment B ever, is likely to be in the thrust be in the thrust washers C C of the steering col umn and D o' the segment shaft Frequently ball bearings are used at C C In time either these or plain washers need replacement ings EE If the stoering gear case is not provided with a grease cup, this is an excel-lent time to put one in Wear on the worm and

segment A B is
not easy to take up, an
approximate cure is to
make the bushings E
ccentric so that by turn ing them the centers of the worm and segment are brought closer together Since, however, most of the wear is in the mid die teeth the gear may be loose in the middle position and tight when the wheels are cramped over There is no rem this, save renewal edy for

The steering knuckle pivots and the pins in the ends of the cross link wear loose in time, and usually it is a shop job to ream the holes and fit new case-hardened pins See that the front wheels are par-allel or 'toe in' very allel or 'toe in' very slightly when pointing aboad It is usual to shape the steering knuckles so the steering knuckies so that the wheels incline toward each other at the ground. They are rarely vertical, and never incline the other way If the front axic is sprung have a blacksmith straighten it

Clean out gear case and test all the bushings in cluding the pilot bushing at the front end of the squared shaft, by shaking them If ball or roller them if loose, if plain bushings they must be re-fitted or replaced New hushings bought from stock generally need con-siderable fitting. SOME PARTS OF A CAR WHICH MUST BE CARRFULLY CONSIDERED IN OVERHAULING

BOW PARTS WHAR IN AN AUTOMOBILS.

### AUTOMOBILE FIRE ENGINES.

### A NEW TYPE OF MOTOR VEHICLE.

The great success of automobile fire apparatus in Europe and in many of the smaller cities of the United States frequently gives rise to the inquiry, why are such machines not used more extensively in the larger fire departments where the highest efficiency of apparatus and personnel is demanded and main-tained. The acknowledged utility of automobiles for pleasure and business even under extraordinary con pleasure and minimess even duter cartanguary code
ditions emphasizes this tardiness the more forcibly,
particularly as the modern motor vehicle is now capable not only of attaining high speed but of carrying heavy loads Promptness in reaching a fire with suitable apparatus is of prime importance, and the auto-mobile in this respect and in endurance is easily superior to a horse To-day with high speeds pumping capacity can be secured in a motor vehicle sufficient for most conditions of service, and this, with economy nce after the initial cost, has led to the adoption of automobile fire apparatus by many of the progressive smaller cities. This economy is obviously due to the fact that only when in operation are gaseline and oil required. A horse even when idle entails expense for shoeing and feeding

Even the most conservative of metropoli tan fire officials realize that the rapid transportation by horses and the subsequent op-cration at high pressure of a heavy steam pumping engine on wheels is more or less a central power stations have largely taken of the small isolated plan when small internal combustion motors using gasoline have been found economical convenient, and efficient. The pumping power of a fire engine depends upon the weight that can be transported. As an internal-combustion motor connected with a pump would weigh much less than a steam engine and boiler and going to a fire would use the same engine for propulsion, it would follow that greater efficiency could be se-

cured Even superior from the mechanical standpoint, but not as yet practically applied, would be the mount ing of an electric pump on a gasoline-driven motor car. using current derived from supply mains near ns of operation Chief Binns of the New York Fire partment has developed such an idea which pos-ses many obvious merits. He proposes to use eleccene of operation seases many covious merits it proposes to use ere-trically-driven centrifugal pumps on motor vehicles capable of high speed and to obtain power from elec-tric light standards or other outlets which are at al most every street corner and quite as well distributed as hydrants. The same condition also prevails in many rural districts, where electric light and trolley lines are to be found on every main street. Suitable liugs and conductors could be used for connections and with the power derived from a central station the and with the power derived from a central station the portable machinery would be reduced to a minimum weight A similar idea, though not so elaborately de-viloped, was put into operation more than twenty years ago by Dr S S Wheeler, now president of the Crocker-Wheeler Company, Ampers, N. J. This apparatus consisted of a bipolar motor directly coupled to a pump, and was mounted on a light carriage. The gasoline motor car was not so highly developed at this time, for which reason the carriage was drawn by es. A fire engine built on this plan was trie on the Eric Canal at Schenectady It was finally brought to Ampere, and was destroyed in a fire which occurred there in 1895 Strange to say, this achems, which would involve comparatively little outlay for a large city, has never been thoroughly and practically

At p nt motor apparatus is most widely used in suburbs and small cities with wooden dwellings, in other words, in communities where its high sperenders it possible to cover a much greater territory by a single company, and where infrequent alarms reduce the expense of maintenance far below that en-tailed for feeding and shoeing horses. For example, a St Louis motor company recently made a run of nine miles to a country villa outside the city limits and ar-

MOTOR-DRIVEN CHEMICAL ENGINE.

rived in time to save the house. This san in a period of eighteen months respond fires without a single failure, and in so doing traveled 2,250 miles in all conditions of weather, including mud, sliest and snow The economy of this company is apparent from the fact that its maintenance account for twelve months was \$48131, including two actions, which resulted in an expense of \$250, as compared with an annual cost of \$516, for feeding and shoeing two horses Even in a district where there are no water supply hydrants, such a machine can make a speedy run, and draw water from a well canal,

In a large city the question of territory is not as important as that of speed in getting the firemen to the fire in a district with high pressure fire protec ccur which taken in time may not require the powerful streams from the fire hydrants and could be put out with a minimum of water damage. Indeed it seems likely that the future fire protection of a large city will consist simply of an efficient high-pressure water system and automobile engines and one wagons.
In a description of modern automobile fire appar

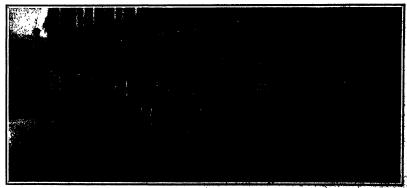

JANDANA IN 1916.

In a description or moners automouse are agreement see may mention, first, the high-speed touring ear or runabout, for the use of chiefs and supervising offi-cials, capable of rapid traval and of covering wide spe-tions of territory. This was the first automobile used by fire departments. Such a car does not usually, easy extinguishers or any fire apparatus, one or extinguishers or any are apparatus, extinguishers and axes or ether tools bendered only in rare instances. All that is demanded a machine is a high quality and reliable model of the control of the cont only in rice machines, and that is tensioned a machine is a thin quality and reliable more is de milleriest speed and early control. In hard, we have the sa thirty man and the Conser are from the same and the Conser are from the control of the Conser are from the control of the Conser are from the control of the Conser are from the conservation of the conservation of the significant to river of this conservation of the con

city Extingulahers and tools are dismossible of the most sidered essential. The chief carries with him not only a chauseur but one or two first ment from the permanent headquarties force. If rapid travel is desirable for the chief, it is of course equally advantageous for the firemen responding to an alarm. In small nremer responsing to an atorin. In small blasse such as those caused by a certain blowing against an open gas light of by a short-circuit of a lighting system, one of two men with axes and hooks promptly on the scene can prevent what might be a "gettions ingly it was early realized that auxilfary or emergency squads could be equipped with motor cars and could be dispatched at high speed to the scene of the fire. These men deal with an incipient fire or prepare for the

steam engines which follow and if necessary send is additional alarms or communicate by telephone with dquarters. This type of equipment is exte used throughout the United State

But it must be realized that this means simply the prompt bringing to the scone of action the trained men who can take care of the smallest kind of a fire ne where the blaze is at all serious. It was with this end in view that automobile fire-fighting facilities were increased by adding a chemical tank and a few hundred feet of small hose. The chemical tank and equipment has now become an indispensable feature of many fire departments. Carried on horse-drawn hose wagon, a small fire can be quenched in its incipiency by its means with a minimum use of water and consequent damage. The chemical tank consists of a copper cistern of from 40 to 70 gallous capacity containing bicarbonate of soda and other chemicals with which sulphuric acid and water may come in

sir respective ends, and after correct adjustment are saided to a certain temperature, insufficient to in rer their temper, and melted solder is then run in high unites with the timing on the spring and sese and spring togeth e as to preclude any possibility of their be-

coming loosesed
The lower springs, i. e, those just above the point
of the wheely tread, are compressed under the weight
of the while while those at the top do not the
the dreumference. The spring pertion is therefore
presciously fonding, for at no part is there any rigid
connection between the inner and outer parts of the
terms whether the regime and outer parts of the
terms whether the rigid and preciously facatine, for at no part is there may right connection between the since and outer parts of the wheel When the whell is in motion the spring and cape in its lower pecton take the whole of the weight of the which and not be not shirt that position relatively with her rim bot do not shirt that position relatively with the rim bot do not shirt that position relatively that the state of the second ship of the second become diseasgaged and move round like the scokes of a rigid wheel their places (unmediately being taken by others: The diseasgand aprings travel forward relatively to the rim in the direction is which the validie is moving. The result is that the central period of the wheel makes a slightly greater man period of the wheel makes a slightly greater man period of the wheel makes a slightly greater man above. At the same time however it is impossible for the laner part to travel round independently or part to travel round independently of the outer rim or tread of the wheel since it is al the owner rim or tread or the wheel since it is all ways tightly in contact therewith at the point of the wheel's contact with the ground which is the point of application of the vehicles weight the rubber strips or approximate or the ventors a weight the rubber strips of the outer extremittee of the springs establishing such adhesion upon the surface of the interior of the run as to prevent any possibility of alipping. Yet there is no perceptible wear and tear upon the two counted surfaces In the case of the driving wheel the gripping power of the spring members is very considerably augmented by having the corrugated sur-face as already described

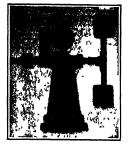

compression of the springs as the wheel revolves is quite continuous and is effected with the utmost smoothness as the spiral springs with their caps can be defected in every direction Sudden jerks or concussions cannot occur which even with pheumatic tires are unpleasant features when traveling

at high speed over a bad road surface.
It may be thought that the absence of rigid con nection between the inner and outer parts of the wheel may be disadvantageous but experience has quite conclusively demonstrated that no such draw back exists It is practically impossible for any alipping between the two parts to occur even when the vehicle is badly driven. There is no friction be-tween the rubbers in the free ends of the springs and the internal surface of the channel rim. The springs as it were walk round the inner circumference of the outer rim on a polished metallic surface and are ely loaded with their due proportion of the car weight during each revolution. The moment the weight is applied to any spring the latter cannot possibly move relatively to the rim until the weight released Consequently there is an entire ab caps will last as long as the wheel tire Even in the rare event of the rubbers of the spring end become damaged it is an insignificant item in renewal

ing damaged it is an insignificant from 'n renoval but no such occurrance has yet been experienced though wheels have been driven for thousands of miles Even the entrance of dost or mid has no detailorating effect upon the two surfaces of the contract of Trials have shown that the average life of the outer solid rubber tire is from 1000 to 1300 miles which is about two and a half times that of the ordinary pneumatic type Though in first cost the Panifer," wheel is more expensive than the pneumatic this dif-ference in initial outlay is soon recouped from the

#### Scientific American

A PAR DYNAMOUSTER FOR TESTING MOTORS

reduced running expenses. It has been found that the cost per mile with the pneumatic averages about 198 cents as compared with 048 cent for the spring wheel—a difference in the latters favor of 150 cents Moreover as the wheel itself is practically everlast ing the renewal charges are limited to the solid rub which costs much less than a pneumatic of nor the water cost much less than a preumatic of the same dimensions and the rubber caps of the spring members. Occasionally as the result of a very severe concussion or joit a spring might break. This can be easily and quickly replaced on the road but as the defaction of the spring is limited in every direction. by the central tube the stress to which the steel is subjected need be no greater than that in the side springs supporting the automobile Such an eventu ality is therefore remote Age in with this wheel in

cred on the inside with padded olicioth, and on the outside with rainproof ducking. The meeting edge of one cover is provided with a patent leather flap and case over is province with a parent leather hap and is held in place in trainit by two large straps which buckle securely and make the tinder rain and dust proof. A small brass hasp and lock is also furnished. A neat little folding dining table is strapped to the in side of one of these lids.

An extra broiler a cooker for emergency a pocket ax and a camp lantern strapped to an outside bracket complete the outfit

The refrigerator and water cooler are fitted with drain cocks. A rigid pair of folding legs is provided to support the end of the body when disconnected from

The wheels have rubber tires and the several parts are so accurately nested that the tender moves even at twenty to twenty five miles speed without noise and takes corners perfectly

takes corners perfectly.

The tender weight 475 pounds and the extra draft on the automobile is scarcely perceptible. It has been used in serving a great many roadsid, dinners and its entire practicability for such service established be-

#### A VAN DYNAMOMETER

The standard type of fan dynamometer shown in the accompanying photograph has been devised by Joseph Tracy it consists essentially of a metal standard carrying a horizontal steel shaft in large ball bear "arrying a horizontal steel shaft in large ball bear ings One end of this shaft is connected with the motor under test by a universally jointed extension shaft the other end (arries an overhung two bladed fan as shown On the dynamometer shaft a small pulley fitted to a bose on the rear of the universal joint is belied to a larger pulley on the special tacho meter which is mounted on top of the housing that carries the dynamometer shaft

The tachometer of the standard fan dyna provided with a double scale and single pointer the wing the revolutions per minute the outer scale the horse power developed. The never lutions per minute scale is argument progressively by divisions of 20 revolutions from 200 to 2000 r volu tions The horse power scale gives a minimum reading of I horse power at 480 revolutions and a maximum reading of 70 horse power at 1980 revolutions Consequently at all ordinary rates of motor speed a simultaneous reading of revolutions per minute can o obtained without any computation The standard fan dynamom ter can be employed in

The standard fan dynamion ter can be employed in testing motors on the block by making suitable con noction between the jointed dynamiomiter shaft and the motor shaft clutch or flywhici it can also be used to test an automobile motor in position on the chassis by disconnecting the propeller shaft and sub-stituting for it the jointed shaft of the dynamometer. The standard dynamometer is designed to test mo

The standard dynamometer is designed to test mo torns of natium sized care. However by the use of fan blades of greater or icas area and suitable tacko-meter scales the range of absorption and measure-ment of power can be varied between wide limits

The Tenth National Automobils Show in Madison The Tenth National Automobile Show in Madisot Square Gardon afforded a good opportunity of inspect-ing the product of representative American makers I he exhibition brought out some novelities in con-struction and design which showed a gratifying lead incy toward standardization. That the modern overy day motor car generally known as a stock (ar has left the misty rone of experiment and is now a practi d useful machine was strongly emphasized by the many performances in hill climbing touring and racing contests of 190). There is a comprehensive display at the Garden of duplicate models of the stock display at the Garden of duplicale months of the stock cars that competed successfully in the various aport-ing events of the year. Some of the original cars are shown. Thanks to the adoption of certain standards a new model need no longer be put this only years of testing before it is entered in competition with other cars Recently victories have been won by certain makes of cars that had scarcely competed in previous

ade by fiexible shaft connection with one of the vehicle wheels.

5. Combination mechanisms, embracing switch and engine hood lock and vibration recorder

Some of these devices are now to all intents practi-ally obsolete and out of the market, and there never cally abo been any general demand for any of them except se intended merely to prevent meddlesome persons and mischlevous children from tampering with ma-chines left standing at the curb The one class of device that is in almost universal use is the lock switch Almost every large manufacturer of ignition spark coils and switches offers a current switch with a reor lever or fitted with a lock and key by which the connection between the battery or mag-

by which the connection between the battery or mag-net and the engine spark plugs can be broken and prevented from being re-established readily. The type of switches with removable plug is illus-trated in Fig. 1. Switches of this type are known as plug cut-out switches and are now designed to be used with a dual system of ignition, so that either the six-tery or magnets can be switched him use or the cur-rent from either of two batteries turned on. When the circle is a second of the cut-ofthe car is stopped, the metal plug, with insulated han die, which makes connection between the two termi-nals within the switch, as shown in the underside view, 1, is withdrawn and the circuit is broken. The Fig. 1, is withdrawn and the circuit is broken. The engine cannot then be restarted until the plug has been replaced or electrical connection has been re-celabilished in some other way. The plug is small and cap be carried conveniently in the pocket. A modification of this type which precindes the po-

A monincation of this type which previous the pos-sibility of inserting a nail or piece of wire as a sub-stitute for the plug is shown in Fig 2, in which the switch lever is removable. There are numerous makes of such switches. The ond of the lever engages by a switch lever is removable. There are numerous makes of such switches. The end of the lever engages by a sist or keyway with a post that prevents it from dropping off and at the same time sensits in forming an electrical connection. The other end of the lever, the with a non-conducting composition handle, can be swang in an are or complete circle to make centure with any desired contact button for use of batteries or magneto or to neutral "off position seems to the second position of the po

sock is applied to a plug cutout switch in such a way as positively to prevent the closing of the circuit through the switch without the proper key or its dupli-cate. The lock is placed directly above the plug socket, thus preventing the insertion of a nail or wire socrac, mus preventure the insertion or a hall or wire The cutout plug is connected with the mechanism of the lock so that it is thrust in or out by the turning of the key The key cannot be removed from the lock until the circuit is broken Each lock requires a dif-ferent key, of which two duplicates are furnished to

The Yale lock, with sliding plus cor The Yate lock, with shiring ping confidence to take the place of the regular cut-out plug, can be fitted to various styles and makes of switches, being beld on by screws of a special kind that cannot be removed to the control of th except with a double-pointed wrench made just to fit m in the screw heads.

the recess in the serve heads. A device of somewhat similar characteristics to the foregoing is the break-circuit autolock (Fig 4), which is manufactured in different forms for use on electric and gasoline vehicles. The type illustrated is for electric machines, but the operation of the two styles is similar. When the switch bar, just above the barrel of the Yale lock, is pulled forward it breaks the circuit and remains locked in this position until one of the and remains occased in this position until one of the two keys furnished with the device is inserted and given a balf turn, when the connection is re-estab-lished automatically by the switch her springing back into place. The electric vehicle lock is installed beneath the upholstering on the arm of the seat, when only the face of the lock is exposed. It takes the place of the ordinary cut-out plug, so that the operation of the lock is no additional bother

The break-circuit lock for gasoline vehicles (Fig 5) is made in different styles to apply to various systems of ignition. It is placed on the face of the coll box, taking the place of the usual switch. The switch-bar is round and provided with a winged head, so that it is round and provided with a winged been, so that it can be rotated to make connection with battery or magneto or to "off" position at will. When it is pulled forward it breaks the circuit completely it is not necessary, however, to turn the bar or plug to neutral

necessary, however, to turn the har or plug to neutral before locking or unlocking the switch. Another means of accomplishing the purpose of pro-buting modifications persons from using a car left standing in the street or garage is the Rochester steering wheel lock (Fig 6) This is hinged so that the hamp can be placed around the steering column. A steel pin at the back of the hasp nature a quarter-inch hole drilled through the outer and inner steering culumns. When the hole in the inner column, to the top of which is larged the steering hand wheel, has the column to the column to the column to the top of which is larged the steering hand wheel, has the column to the lock has been innered through lock. prin of the lock has been inserted through both, the front wheels cannot be turned.

The special feature of this device is the combination ock that renders unnecessary the use of a key, which may be related foresten or lost. The barrel of the contains three tumblers each provided with a lock contains three tumblers each provided, with a small lag on either side which engages with the cor-responding lag on the next tumbler. Two tumblers are restanded to an internal tap cap but are free to retate on its center pin, while the third tumbler is re-movable and lies in the body or casing of the lock over a solid post that passes through its center. All the tumblers have a large notch is the periphery To open the lock it is necessary to turn the external dist hand into line, allowing the each of the hase to pass. This can be done only by working the lock combination. The lock can be oversited in the days in the dail is

The lock can be operated in the dark, as the dial is otched so that by starting at 0—which is distinguished by a large or open notch—the movement of the hand over the dial can be counted as the spring points drop over the dial can be counted as the spring points drop successively into the serrations. When the lock is open, the combination can be changed in two mileutes if desired Except for the stead plan, this lock is made entirely of brones and is made in different sizes to fit sterring columns of different disensets. The nanuta-turers have also produced an adjustable hasp steering column lock made with four-tumbler combination and operated by a key

In division B of group 2 is a new invention brought out this season under the name Bongartz autoloch (Fig 8) The device is designed as a lock to prevent use of the gear shift lever and, if desired, also brake lever It consists of a simple lock incas pollshed heavy brans case to be attached to the side of the car or the footboard directly behind the lever of the car or the footboard directly behind the lover quadrant, and a rod with a bead on one end and a recess in the other end to be engaged by the plunger of the lock. With the gear-shift lever in neutral or in operative position, a hole of suitable size is drilled through the quadrant and shank of the lever to receive the rod The lock case is then secured to the body or frame in such position that the hole for the end of the rod will be in alignment with the hole drilled through the quadrant Now, when the car is stopped and the gears unmeshed, the rod can be inserted and engaged in the lock, when it will be impossible for anyone not

ascening the key to start the machine.

A notable advantage possessed by this device is that, A notanie avaniage possessed by this device is tank, while preventing the ear from being driven on the road, it does not interfere in any way with its move-ment by hand in the garage or with the adjusting and "tuning up" of the engine and its attachments by the chauffeur or workmen.

chauffeur or workmen.

Not only is it sessential that the unauthorised use of motor cars should be prevented but it is almost to under cars should be prevented but it is almost the speed esthusiasm of the hired chauffeur even when need to be over its occupying the tonema or interior of the time of the owner is occupying the tonema or interior of the time of the owner is occupying the tonema or interior that the owner meds a check in himself, as it that the owner meds a check on himself, as the exhibitation of a good road, bracking simmephers, and other than the owner and the owner of the owner owner. smoothly running car he may unwittingly let enthu smoothly ranning car he may unwritingly let children slasm overstep discretion. Numerous afforts have been made to produce something that would accomplish such results by the sounding of audible signals when the car had attained to a certain speed or by the dis-play of a prominent speed indicating device that could be read at a distance by every passerby. The objections re read at a distance by every passer-by 'I'mo opercions to these devices, however, were so obvious that they never met with favor except on the part of persons stilleted with motorphobia and lawmakers eager for popularity among their constituents.

A practical device intended to accomplish the same results in a much better and more effective way has been brought out recently for use in combination with a well known make of speedometer This is the Jones automatic speed-control governor (Fig 9) The mechautomatic speed-control governor (Fig 9) The meen-anism consists essentially of a speed indicator, an automatic circuit breaker. a controller switch, and an electrically operated air valve, not indicated. The electric switch, which has five or more points of contact representing circuits, is operated by the action of the centrifugal governor of the speed indicator. The switch is so arranged that when the indicating hand of the speedometer shows a speed of ten miles an hour the switch will close the circuit through the first conthe switch will close the circuit through the first con-lact, when the velocity of the governor is such as to indicate fifteen miles an hour on the dial, the switch closes a circuit through the second contact, and so on up to any desired number of speeds or contacts.

on up to any desired number or speeds or contacts.

By setting the pointer at any figure on the dial of
the controller switch, the circuit can be made to
close through the corresponding contact only and
at the indicated speed When this circuit is closel, at the indicated speed When this circuit is closed, it actuates the current to the primary of the inflowtion or spark coil, thereby cutting off the spark from the angite Or it may be arranged to operate the electrically controlled air valve or throttle, shutting off the supply of air or gas to the suchus and thereby prevanting the speed of the our from exceeding the instead limit. As soon as the speed is reglaced, the contact automatically cuts for and the suggipe soft is prover again. Blooml the politics of the ogertrelling switch he set at an intermediate position, as in illustration, the device will have no action whate on the speed of the one.

as the operate mixer.

As the controlling switch can be located abuset anywhere in the car, it is evident that the owner or any occupant of the rule heat can limit the speed as desired, regardless of the driver. The device operates

desired, regardies of the driver. The device operates stiently and is always on guard, giring a sense of security in passing through sections where the speed regulations are rigidly enforced. An example of the vehicle movement indexing instruments cleanized under A, group 4, is the valid-dey ribration register (Fig. 10½) This operates on the principle of the pedemeter, 4 pendium or weighted arm being held normally in a horisontal position by a light spring and caused to best by reason of the momentum of the weight following every downward and mowest movement of the instrument. Each beat and upward movement of the instrument. Each beat and upward movement of the instrument. Back robat of the pendulum releases a tooth in the train of gears which actuate the indicator hand and register figures on the dial The dial is 2½ inches in diameter and is divided into 100 degrees. These divisions do not represent either hours or miles, but serve as a measure of the vibrations. Different cars oscillate vertically in different periods, it has been found, but each machine orcillates very nearly the same number of times for successive miles irrespective of its speed. Engine vibra-tions when the car is standing still do not affect the instrument, therefore the device makes no record ex-cept when the vehicle is in motion.

The instrument is intended to be attached permi ently to the car so that it cannot be removed with needily to the car so that it cannot be removed without the owner's knowledge and is securely sealed so that no one can tamper with the register There is no shaft or wires connecting it with any working part of the automobile whose detachment or disconnection would render the recorder inoperative. The owner, having by observation determined that on his n

having by observation determined that on his machine the instrument indicates any 10 points for each how of travol, will have no difficulty in determining from the reading of the dial how many hours his machine has been driven after he leat had it out.
A different type of whelice movement indicator is represented by the Bullard recorder (Fig. 7) This provides a permanent record on paper of the hours during which the while was used, the rate at which it was run during every mile traveled and the number and duration of stops made. It operates by a combi-nation of clockwork movement and flexible shaft drive from one of the road wheels. The clock mechanism rotates a circular paper dial that makes one complete revolution every hour in the same direction as the hands of a clock. The dial is divided into sixty radial spaces representing minutes, every fifth line being spaces representing minutes, every fitti line being heavier than the intermediate lines for convenience in reading From center to circumference there are twelve circular divisions, also corresponding to the hours. Within the instrument is a stylus operated by both the clock and movement of the car, which makes a perforation in the paper dial for each quarter mile traveled, every fourth perforation being deeper than the others to indicate the completed mile. The stylus is at the extreme outside space when the instrument is r a record and moves toward the center at the rate of one space each hour, being moved by the clock and requiring twelve hours to move across the dial, where it becomes inoperative until reset.

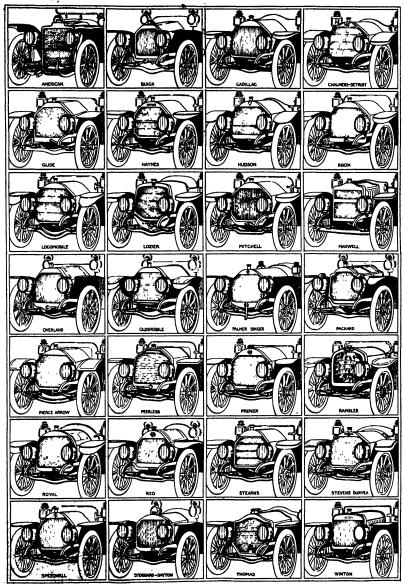

So long as the car stands idle the dial rotates with-ut being punctured by the stylus, but for every quarter mile the car travels (if a pleasure vehicle) one perforation is made. And according as the machine is driven fast or slow the holes are close together or er part. At the rate of a mile in four minu fifteen miles an hour, there will be just one hole for ach radial division, while at sixty miles an hour there would be four By examination of the dial it is non sible to determine the exact hour and minute at w sible to determine the saxet hour and minute at which the car was started and stopped. Combined with the instrument is a tiny ofcensive which registrar the total misses up to 10,000. The instrument depends for misses up to 10,000. The instrument depends for clockworf and the same connection with the readed upon the perforating system because it, cannot be tampered with without detection, no iar or joil of the car can desuage it and odd weather or dry common reader it incorrective. For use on commercial which me the car can desuage it and odd weather or dry common reader it incorrective. For use on commercial which me the car can desuage it and odd weather or dry common commercial which is the control of the car was provided in some commercial which we consider the control of the car was a supplicable to the control of the car was a supplicable to the car was a successful which is nected of every quarter.

### MAKING YOUR OWN REPAIRS.

BY ROGER B. WHITMAN.

To one who is familiar with the methods employed in the average automobile repair shop it is not sur prising that warrs of ears complain of the size of their bills. Intering that the intering is usually for labor at so mu h an hour but there is no way in which at so mu h an hour but there is no way in wonk a the own r can assure himself that part of the time charged for was not wasted The difficulty of check log a labor charge is an inducement to a mild form of swindling and it must be admitted that there are shops in which an hours work by an untrained hop is charged for at the rate for skilled labor. The again time may be wasted unintentionally. It is not again time may be wasted unintentionally it is not unusual to find that after assembling an engine not agearsat the work must be undone in order to fit an overlooked part or to correct an adjustment that should have been attended to in the first place and in such an event the total time occupied is usually charged to the owner of the car

When the prospective purchaser of an automobile is of a properly inquiring turn of mind he will ask his friends to let him see their bills for repairs and maintenance and will probably gain the impression that automobiling is an expensive diversion—if he has any mechanical ability however he will realise that three-quarters of the work charged for could have been done with simple tools and an ordinary knowledge of

own work becomes no familiar with the mechanism that it is institutive with him to recognize the signs of coming trouble if corrects faults at their neption and by so doing be obvistes an otherwise inevitable delay and expense Aside from the economy of it the owner who does his

The following notes are offered as suggestions to the owner who desires to render himself independent

VALLE GRIEBLING

At more or less frequent intervals the valves of a gazoline engine and particularly the exhaust valves will become rougheed and pitted. When they are in this condition they cannot be expected to retain the compressed gases and in consequence the engine can not deliver its full power. It then becomes necessary to grind in the valves which is accomplished by in troducing an abrasive between the valve and its seat troducing an abrasive between the valve and its seat and rotating the valve under light pressure until the surfaces are worn smooth. This is usually considered to be a job for a repair man but as it is patiente rather than skill that is required the car owner need

not hesitate to undertake it

Before grinding can begin the valve must be re
lieved from the pressure of its spring in many en gines the valve seat and spring are contained in a cage that is easily removed and the detaching of the spring from the stem is an easy matter. When

the valve seat is integral with the cylinder the spring of a special tool or by a flat metal bar used as a lev r lo prevent the valve from mov ing a small block of wood may be placed between the valve disk and the valve cap When the spring is compressed the device through which it acts on the valve stem may be removed. He valve may then be taken out through the valve can open

When a valve is in bad condition the surfaces of the disk and seat are rough and pitted. It is not necessary to continue the grinding process until the entire width of the surfaces is smooth for a narrower ting ot belt is sufficient to retain the gaves if it is entinuous and unin

terrupted Findly powdered enery mixed with ma chine oil is a satisfactery abasine but whatever is used great care must be taken to keep it out of the cylinder and away from the bearing surfaces. The laneage between the valve pocket and cylinder should I tightly plugged with cotton pasts a string fied to it () illitating its removal when the work is completed her a hadly worn valve the first grinding is done with course emery which is later replaced by a finer

grade to give the requisite smoothness. To apply the abrasive dip the finger tip in machine oil and then it dry emery the small quantity that adheres being applied to the valve surface. The valve is then replaced on the sear and rotated by means of a screw excellent results may be obtained by means of an 8 inch or 12 inch screwdriver with a round grooved handle which is held between the extended paims A con

tinuous rotary motion in one direction will tend to tinuous rotary motion in one direction will tend to wear the valve oval and it is necessary to turn it first in one direction and then equally in the other A slight back and forth motion of the hands will give this result and as only a light pressure is neces sary it should not prove tiresome

In order to preserve the true circular form of the valve and seat the valve should be lifted after twenty or thirty turns and replaced on its seat in a new position To facilitate this a few turns of a helical spring may be placed in the valve pocket under the disk its size and strength being such that the valve will be slightly lifted from its seat when pressure is taken off the sciewdriver. The location of the spring is shown in the diagram

is shown in the diagram

When the vulve surfaces appear amouth all traces
of the emery should be washed away with gasoline
case being taken that it doos not lodge in the vituder
valve siem and push rod guides or other bearing
parts 10 test for the make peace! marks on the
valve seen and give the valve a turn or two with the acrewdriver if the fit is correct the marks will be erased

The replacing of the valve apring is greatly sim lifted if it is compressed in a vise and bound in the plified if it is compressed in a vise and bou plified if it is compressed in a vise one compressed state by light iron or copper wires principal it lengthways. The spring may the

to notice the exact posttion of a piece betwee he takes it off and in general is unobservant or the forestgift that would go her to simplify the reasonability of all time is not an object he will overtually get all the parts properly rebuilt but if he aspires to be a good man he must leave to be methodical in everything

The first step in diamounting any part of an auto-mobile is to ascertain what holds it in position what other parts may have to be displaced in order to get at it and what parts may be released by its re-moval To take off an inlet manifold for instance it may first be necessary to remove the carburster which in turn will require the disconnection of the gasoline

plps and throttle control.

The plan of action having been determined work
may begin it will greatly facilitate reassambling if
nuts boits screws and other small parts are placed in boxes the parts belonging to the inlet plps in one, inspection plate bolts in another and so on if these larts are laid indiscriminately on the engine and frame they are only too likely to fall into hand holed and other openings and aside from the difficulty of secovering them they must then be sorted

16 overing them they must then be sorted
Where several parts are alike in shape and size—
valve caps for instance—it should not be taken for
granted that they are interchangeable
Bach may
have been direct to its particular location and on the
chance of this they should be marked before being removed so that there may be no error in returning them Home manufacturers are careful to mark all parts by letter or figure or with a prick punch and when this ister or squire or with a price punch and when this is the case the marks should be followed absolutely in the case of greats it is usual to make three punch marks at the point of meshing. To reassemble them correctly it is then necessary only to place the marked tooth of one goar between the two marked teeth of

When taking off a cylinder the connecting rod should when taking on a cylinder the connecting rod should be blocked or supported Otherwise the weight of the piston will bring it sharply against the crank case which may suffer in consequence. If the cylinders are to remain off for any length of time they should be plugged with cotton waste at all oper ings and several thicknesses of paper should be tie es of paper should be tied around the pistons

In reasonbling, all nuts boits and screws should be cleaned and clied before being replaced. Every boit has its wrench of appropriate size with which it is hardly possible to exert a breakage strain. When an 18 inch wrench is used on a % inch bolt there is every possibility of the bolt head being twisted off before the operator realizes that it is in danger

If the parts of a properly made machine do not come off with reasonable freezess when the boits and nuts

are removed force should be avoided until it is proven to avoided until it is proven to be necessary Taper pins keys and unamspected set screws are frequently re sponsible and as they must be accurately replaced their ioration and direction should be noted and remembered

It is poor policy to rush a piece of work and after a few experiences with com pression water and gasoline leaks that could be avoided texas that could be avoided by giving more time to the job in hand the metorist will hang in his shop the Go slow, go and abide by it

and abide by it

AUTOMOBILE NOTES.

Undoubtedly the weak points in the pneumatic tire whether it be that of a cycle or motor vehicle, are its cost of up-keep and liability to puncture that the direction in which improvements have been made is in the thickening of the tread, so as not only to render punctures less frequent, but also to give the tire a longer life, and thus save expense. In som-makes of tire, the increase in thickness of the treaof the outer cover, and in others that of the inner tube has been so great that most of the resiliency has been lost, and the tire practically becomes a solid one order to restore the resiliency, it has been proto reduce the air pressure in the internal tube, but this causes not only excessive internal friction between the inner tube and the cover, which is in any case difficult to avoid sitogether, but also produces a large flat surface, in contact with the road, which adds con siderably to the tractive resistance, especially when the surface of the road is soft. The evils of traveling on slack pneumatic tires are known to all cycle riders and are (arefully avoided by keeping them inflated and are (Arinn) a routed by arming them instances with a sufficient air pressure which it is necessary to maintain in the inner tubes of the pneumatic lires of a heavy vehicle is not less than 100 pounds per square lach, and should the slightest defect occur which allows the air to escape, the tire is not only rendered useless to support the vehicle but is speedly damaged if the collapse is not quickly repaired

At the Tenth National Automobile Show in Mad At the Tenth National Automobile Bhow in Madison Square Garden there will be the only complete motor cycle cabibit in New York in 1910 by the Motorcycle Manufacturers' Association An inspection of the new models on display there proves that the motorcycle not only is a pleasure vehicle for poor and rich alike-ranging in price from \$100 for the small single-cylinder machine to more than \$500 for the expensive four cylinder touring model de inse-but a utility vehicle as well General refinement seems to be the tendency for 1910 Many improvements have been made in spring forks as the result of hard road contests during the past year Some of the machines appear with apring frames and longer wheel base, all of which make for the comfort of the rider. As regards the ap-pearance of the motorcycle better quality and more lasting enamel as well as heavier plating seems to be the aim of the manufacturers. Handlebar control is practically universal, and magneto ignition will be more practically universal, and magneto ignition will be more popular than ever, several of the makers kaving decided to make this type of ignition standard couplement, instead of optional as herotoforn Increased power apparently is a general tendency, and mechan rical ollers are also in evidence, which oliminate guess-vork is lubrication, one of the bugbears of riding Several of the manufacturers have decided to aboilish the number cutous which, with the number improvement noticeable, should make the motorprive of 1910 nt a steed as its forerunner, the bicycle.

Two Chalmers-Detroit chassis models will be manusctured in 1910, the "Thirty" and the "Forty," both both ractured in 1810, the billing and the Porty, both a continuation of those presented for 1909. The clanges, while important, are not in any case radical. The new Chaimers-Detroit 'Thirty' will have a 115inch wheel base, three inches longer than the 1909 Forty It will have 34-inch wheels—two inches Forty It will have 54-inch wheels—two inches larger than last season. The hood will be three inches longer and two inches higher—in keeping with the harger body. The 'Inhirt' motor is more powerful but year than its Tan 1010 'Forty has a 122 inch wheel base—ten inches longer than last season. It has 36-inch wheel, and room for seven passengers. The 1969 where, and room for seven passengers. was a five-passenger car

The Tenth National Automobile Show in Madison Square Garden eclipses any former exhibition of motor cars, motorcycles, and accessories ever held in the famous building. There is a total of 323 different the Amous building There is a total of 333 different displays, of which there are 3 exhibits of complete care besides 246 exhibits of accessories and parts, and 71 motorycle exhibits Fress with an increase over last year of more than 7 000 feet of exhibition space which the show managers by ingestions mathods were shit to the out of tha Garden Interface, there is not not tool to must game a variable for exhibition purposes. This situation is indeed a striking commentary on the growth of the industry when it is realised that at the first automobile show in this country, in 1900, there were only 60 exhibitors who displayed their product in the Garden

Noteworthy among the runabouts costing much I than \$1,000 is the Hupmobile made by the Hupp Motor Car Company Detroit Mich In its constrskers have endeavored to impart to their tion too masors have conceived to impart to their runabout all its stanniness carcilient workmassin, and trustworthiness of the seven passenger touring car. The four-yillnder eagint is of 20 hone-power, with four cylinders having a stroke of 3%, inches and a hore of 3% inches. Water cooling is supplyed. The trustmission is of the selective sliding goar type. The multiple disk cittach runal is oil. The pure sale is shaft driven. There are two foot brakes and two. brakes. A Bosch high-tension magneto is

Something new in the Carden show is to be found in nearly every one of the models exhibited. Some the new points of interest are found in axies, anazumentons, and in inbricating systems. In bodies, transmissions, and in inbricating systems. In bosses, a type that seems to be gaining favor is the four-passenger surrey, which is but a tonneau without doors, built low in the back and idea, yet providing plenty of senting space. The cars at the Garden show range from the occultent on the market down to the lit-tle runshout that is cheap smough for anyons.

In 1901, Mr Byron J Carter, then of Jackson Mich, realising the shortcomings of geared trans-missions as used in automobiles, began experiments for improvements, being naturally attracted to the friction system because of its manifest advantages After months of careful research, the first Carteron After months of careful research, the first Cartervar rickine-driven automobile appeared in the summer of 1903. This automobile was of the runsbout type, and in addition to the radical improvement in transmission parts, was well designed and constructed. The car has run more than 25,000 miles, and is now, with out repairs, apparently in condition for

A remarkable car has been brought out up un Schaoht Manufacturing Company, of Cleveland, Olih The car in question is imprincing convertible Or dinarily it is a runabout. By the addition of a curre seat the runabout is transformed into a four-passenge and the company of the co arkable car has been brought out by the al box back, is converted in o a light delivery The vehicle is illustrated on the double page of cars appearing in this issue.

The present four-cylinder Cartercar may be regarde as an improvement of the former two-cylinder me without a single radical change. This car will appear in the coming season in two sizes. Both have the Car-ter friction transmission, the nucleus around which the first Cartercar was built

The most grueling sort of endurance contest in which motor cars have participated are 24 hour races As a rule out of about fifteen cars sta events only five of them finish at all, the remainder events only five of them finish at all, the remainder breaking down in the ocurse of the contest from some mechanical weakness. Bonse cars have started in sight or more of these terrific grinds and have never finished once. At the 28 hour race beld at the A Y P Expedition at Seattle, a Hudson "Ywenty" stock car weep around the course for hours at a time making mile after nile with the utmost consistency in a 1 15 clip The construction of this car is interesting, its low selling price is considered. The rear at d The rear axie is of the semi floating type, shaft driven, and is strong; reinforced at the points where the greatest shocks and strains occur Two large double-acting brakes are d at each end of the rear axie built for the man who is satisfied with a speed of 55 miles an hour The motor, four-cylinder vertical, water cooled, is simple, very strong, and amply powwater cooled, is simple, very strong, and erful The transmission is the three-speed selective type used on all standard cars.

Many an inventor has probably wondered whether the patent law forbids his experimenting with a pat-ented invention. The answer is: It all depends upon the ested invention. The saswer is I relia depends upon the character of the experiment. Suppose that an inventor is interested in fying machines, and that his primary object is to improve the Wright machine. He has be the privilege of building a Wright machine himself and fy-ing it, in order to study its performance as well as to acquaint himself with the art of fring! We high: acquaint numbers with the art or nying? We think not. He has no right to build the machine for the purpose of learning how to fly or for studying its performance in any way. Had be besent the machine from the Wright brothers or their licessees he would ubtedly have the right to use the m

fantani va tojo,

1810 Registrations and Escapetal Insumed as considerable doubt, and in some constraint, some to grim in report to the 1740 regist tens and lonness in different State, the Burean Tours of the Antomobile Club of America has not a chart showing just what States require reg a chart anowing part was according to provide the confidence or license for the new year, where spacewis are hepensary, and where the old registration or license is skill operative. A synopole of this chart for New York, New Jersey, Pennsylvania, Massachusetts, Connecticut, and Rhode Island is as follows: New York.—Registration of cars in New York

are perpetual on the car originally registered. If our changes ownership, the new owner must re-register same. If new car is purchased, same must be regis tered. Transfers are not made.

New Jersey -Registration of car and driving liou

New Jersey --Ragistration of our ann criving plombs is required annually, and same can be procured direct from the Bureau of Tours of the Otub.

Pennaylvania.—Pennaylvania requires both registration of car and driving license annually, application bhanks for which can be precured from the Bureau of Tours. Non-residents, of States that reciprocate, are altowed the desert examption from perfects the property of t

Tours. Non-residents, of Hates that reciprocate, and allowed ten days' exception from registration. Massachusetts.—Registration required annually; also driving license for owner and chauffour Owner's driv-ing license perpetual; chauffour's driving license good ing license perpetual; chausfeur's driving license good for one year from date of issue—the latter renewed for 10 cents Non-residents scenpt for seven successive days Non residents owners may drive, but chastifeurs must procure driving license. The Bureau of Tours can procure temporary driving license for non-resident chausfeury, provided chausfeur oan procure criticates of good character and recommendations.

Connecticut —Registrations are annual, expiring D combertell registrations are annual, assuming to comber 31st Annual driving license required by owner or chauffeur Non-residents exempt for ten days from registration and driving licenses.

Rhode Island —Registration and driving license re quired Fees of registration based upon horse-power Non-residents duly registered in home State are exmot for ten days.

Ricetron—A Metal Lighter than Alquaintum. According to Kosmos, a technical review appearing at Pforzheim, the Grissheim-Electron works exhibited at the aeronautic exposition at Frankforton-the-Main its novel patented alloy, the metal "electron," which is claimed to be much lighter than aluminium and at the same time much more durable.

lightest metal employed for technical pu up to the present time has been aluminium and som alloys of aluminium, the strength and the du of which are however lower than those of the new metal. The density of aluminium and its alloys has been nearly 3, and they are about twice as heavy as electron. The chemical works of Griesheim-Electron has discovered that magnesia is utilizable for technical purposes. By the admixture of magnesia, the pric of which is comparatively low, with one or two metals an alloy is produced of a density of 175 to 2, possessing great solidity, strength, and elasticity, and at the same time readily workable. The color of these alloys esembles that of silver, and they possess great so rous quality

rous quanty

The new metal is said to behave very well as regards change of temperature, and it responds to all
technical requirements, in the sir it becomes covered
with a coating of protective oxide. As east metal, it
oftens a resistance up to 18 kilogrammes per aquare millimeter and has at the same time an exte

useful in the construction of simple and automatise insumeds as in most of its proporties it is superior to aluminum and its alloys. In manufactural the same object, one work require at least to pic questions of electron than of aluminum. The "Expelia" airning requires 4,600 histogrammes of aluminum, which costic to replaced by 5-50-kilo-grammes of electron. A large association contribute for mechanisms of electron. A large association contribute for mechanisms, when the fill interpretation of the contribute of the political of the property of the political of the contribute of the political of the contribute of the political o

THE MOTOR CAR AND THE READ.

(Continued from page \$7.) out binders include the potro manust opposts memore the port-one containing an apphaltic best, the sides of such petroleums, the heavy s, pitches, and numerous oil, tar, and shalt preparations. In addition to se, a few special materials have been se, times, a new special materials have been the suffect of experiment, such, for ex-sumple, as the wasts product from the best and case sugar factories. In some instances give and bichromate of potash have been added to oil or tar emulsions to cause the residue upon the road surface to harden after the volatile products have evaporated. Waste sulphite liquors from wood pulp have been employed with rron wood pulp have been employed with some success in a concentrated form, and, in fact, the list might be indefinitely extended. The essential requisite in a dest preventive is its bluding power, and it naturally follows that the experiments will cover a wide field.

Water, while small the most above.

Water, while usually the most abun and cheapest material, is very often, be-cause of the frequency with which it must ed, the most expensive to us be applied, the most expensive to use. Its binding power is almost entirely due to capillarity. The value of the sait solu-tions commonly used lies in the hygro-scopic character of the dissolved sait, which, having considerable affinity for water, keeps the read surface in a moist condition long after a surface treated with water alone would have become dry through evaporation. The light oils and tars, as well as the oil and tar emulsions. are dependent for their effect upon the retention by the road surface of a comparatively small amount of true binding bee tively small amount of true binding base after the volatile products have evapo-rated. This base proves effective only as long as it rotains its binding power is When the binding power is destroyed, it is necessary to apply more material. If the base is an exceptionally good one, the accumulated products finally harden the road surface and prevent wear to some

The heavy olis and tars differ from the lighter products in that they contain a much greater amount of asphaltum, which much greater amount of asphantum, which constitutes the binding base. The results are, therefore, of a more lasting charac-ter, and hence the name permanent bind-ers. The semi-solid and solid prepara-tions usually contain a still greater tions usually contain a still greater amount of binder With some few ex-ceptions, all of the true binders are bitumens, and these bitumens may be ofther natural or artificial

matural or artificial The usual method of applying these ma-terials to the road surface is by aprint-ling. The temporary binders can usually be applied cold, but the permanent bind-ers, because of their much greater vis-cosity, must be heated until sufficiently finld in England and France the use of finid In England and France the use or coal tar is practised to a large extent and their methods of application have been highly developed. Machines are in gen eral use which are self-propelling and in which the tar is heated and then applied which the tar is heated and then applied to the road surface as a spray under high pressure. These so-called "far sprayers" are not only very economical in the use of tar, but insure a more even distribu-tion and better penetration of the road surface than it is possible to obtain in

almost any other way.

In the construction of dustless roads, the crucial question is that of cost. Autoobiles have but little destructive effect mobiles have but little destructive ensert on payements, but these are in general too costly for country roads. The effort must be to develop a form of construction which will withstand fast automobile and at the same time be within the financial reasonness of the community. This is largely being gions at present by the set of a bituminous binder instead of the rock dust. The two methods generally employed are known as the possersation and the mining method. In the former, the bot liquid binder is sprinkled or servered over the stones and allowed to passersate through the vedic hast once the stones small by an doubt of two or three biness bandlers has charged and surface of the reason small by an doubt of two or three biness had been also the read surface by means of home of several severance. In the michine case the more of severance, in the michine of heavy of promise. In the mixing

### "This Car Can Be Run 5,000 Miles a Year at an Average Total Cost of \$3.98 a week"

Here is a Big Touring Cur that will interest thousands of men who have always considered an automobile beyond their means-not because they couldn't afford to buy one, but because they have felt they couldn't afford the cost of maintaining one It is true that the expensive "up-keep" of most automobiles has put them beyond the reach of men with moderate incomes. . Not so with the Maxwell. Our cars have always been the most economical to run, as over 20,700 Maxwell owners have proved. Our constant aim has been to make automobiles that the mass of the people could afford to own We have kept right on from year to year improving Maxwells in every smallest detail that would reduce their operating expense-increasing strength and durability, decreasing weight, and simplifying construction

Now we are satisfied that in our new 4-Cylinder, 30 H P. Touring Car we Economy Car" What does it actually cost to run? This is have the great what the majority of men want to know, and this is just what you don't find out about other automobiles—before you buy them.

method, the stones and hinder are thoroughly mixed, either by hand or machine, sugnly mixed, either by hand or machine, so that each stone is covered with a thin film of the binder. This method in gen-aral insures the better and more even dis-tribution of the binder throughout the

very largely with different sections. In England and France the tars are used very largely. In the western portion of very largely in the western portion of the United States, the heavy asphaltic offs of California are used almost exclu-sively, while in other sections we find that tars, residuum oils, liquid asphalts, and various proprietary compounds are

One of the chief causes of the gree number of failures which have been re-corded in the use of bituminous road ma-terials is the failure of the user, as well terials is the failure of the user, as well as manufacturer, to understand certain fundamental principles. To many, a tar is simply a tar and oil an oil, while in reality there is a wast difference sometimes even in the tars produced at the same works. The oils also range from those of a paraffine base to those almost wholly asphaltic Thus a concise knowl edge of the character of the product, the process followed in its preparation, and the affect which varying conditions will have upon it is necessary in order to avoid costly mistakes.

### THE MIDDLE WEST AND THE AUTOMO-

(Continued from page 48) that the freight has usually been added to the purchase price of the car, and many cases in the past, and there will be many more in future, where the cars are sold directly at the catalogue price. For that reason, the location of factories in the middle West was ideal, for it is in truth the center of the automobile-buying

In some cases, cities have been made over and their population doubled and trebled by big motor-car factories, as in the case of Flint, Mich, and New Castle, Ind. Such cities have had a tremendous boom in real estate and in husiness gen r, owing to the influx of 2 000 fo families, and have assumed an entirely dif ferent position on the map because motor-car factories were established within their limits Besides supplying employment to laborers in large numbers, much money has been made by the leaders in the vari-ous enterprises. This has been especially true among the makers of wheels tires, frames, and other parts in a general frames, and other parts in a general way it may be said that the parts mak ers have made more money than the auto-mobile builders, as the latter have ex pended greater sums of money in experi

The total capital of the automobile manufacturers in this country is about \$225,000,000 The actual value of the plants will run into some extraordinary figures, and these values are rapidly oreasing As for the output for 1910, it is likely to exceed 200,000 cars, although there may be a slight failing off from these figures, owing to the inability of paris makers to supply the demand There are now about 150,000 automobiles in use in this country. In a general way, it may be said that the employees num it may be said tast the employees hum ber some 120,000 fm motor (ar factories with employees in parts factories reach ing not less than 40,000, a total of 160,000 America may be safely considered the home of the low-priced car, a condition nome of the low-priced car, a condition brought about by the tremendous buying power of the middle classes, who demand a car which can be cared for by the owner without the aid of an expensive chauffeur

These low priced cars have been made ossible by ideal factory methods and big production This recognitated their being standardized, something that may be said to be original with the American maker, who feels that any one of ten thousan parts should be made to fit any one car turned out by his company

By working on big productions and

brakes.

Tires influence the performance of an electric automobile more than may be imagined Various designs of tires show a variation of up to fifty per cent in efficiency, so that the speed per single charge of the battery is affected. Speedial points to be borne in mind in the care of manuscript fifty are that runs as well as pneumatic tires are that rust as well as oil is very detrimental to them, and that oil is very detrimental to them, and that it is necessary to keep tires well inflated. It is necessary to keep tires went innaces.

If the storage battery of a few years
ago be compared with the up to-date battery, it will be found that a very much

### HOW TO OVERHAUL A CAR

(Continued from page 58) on for this is that the shafts, es son for this is that the sharts, es-pecially gran shafts wear down and noust be ground true and no manu facturers seem to appreciate the useful ness of boring repair bushings slightly under size The pilot bushing being solid must be specially made to suit the shaft Aside from this one a skillful amateur Aside from this one a skillitul amateur can make a good job of scraping his own bushings if he has a suitable set of scrapers and time and patience. Red icad is used to test the fit. Of course the gear case n ist come out of the car and at intervals the bushing caps are boiled down tight and the shaft turned to de termine whether it is tight or free and whether it makes contact all over

whicher it makes contact all over in refitting gear shafts and bushings it is necessary not only to achieve a proper fit but to keep the shafts abso-utely parallel. If they are not the gear teeth will not bear squarely across their tecth will not hear squarely across their far but will wear away at their con ners as raggerated in the dotted por tions lig 4 In the matter of gear replacements the

In the matter of gas replacements the best result is naturally gained by replacing b th mating goars if sither is badly wors aim othersise the new pears would have to run against a bad profile and would west away sooner. If the car has sid thain drive the differential shart bushings will need rediffing at the same time. The parts of a differential which war fastest are the bushings A of the squ or bevt, platons R (Fig. 5) since these are the fareds; things to tubricate these are the fareds; things to tubricate these are the hardest things to lubricate To take the differential agart it may be nicessary to file the ends of braded over came the nuts should be reduced in thick tame the nuts should be reduced in thick nuss so that the holts can be headed over again on reassembling (The bolts in hig r do not go through) It is very important not to give anything about the differential the slightest chance of work ing loose and the same applies to the bolts holding the change gears. Another point that is difficult to oil and therefore the differential or gear hub and the sleev into which the hub of the differ ential shell extends This sleeve runs in plain or ball bearings in the case with the shaft or gear hub turning inside of it whinever the car goes around a turn Booner or later new bushings are ne eded

If oil is used in the gear case as it must be if piain bushings are used in stead of ball bearings it becomes some-thing of a problem to lubricate the bear ings effectively without excessive leak age of oil the witti solders a thin wire gauss streen (Fig f) over the interior oil pockets to exclude steel grit worn from the grars in order to prevent es cape of oil from the ends of the bush ings a felt ring is necessary (Fig 6) This ring would cause the oil near it to become stagnant were it not for a specia obscious sanguant were it no in a special solid groove & which should be chipped en tirely around the bushing and connect with a groove ( by which oil entering it may return to the interior of the case But for this provision partitles of dirt tting into the end of the bearing would accumulate and cut the shaft

In the rear axle of a shaft-driven can the thing most likely to need replacement is the differential i bere are various ways of getting at it depending on the design of the axio casing. If the axie is divid d vertically in the fore and aft central plane the rear springs must be in kid 11 and disconnected from the axle haives of the axle drawn as after taking off the wheels. A better ar rankement is to have a removable cover plate on the asing through which the differential is instited and withdrawn This is found especially in axies of the rais is round expectany in axis or the floating type with wheels running on ball or roller boarings on the ends of the axis tubes and driven by floating shafts extending from the differential to jaw of lutch plates (neaging the outer ends of the wheel knubs To remove the diff ferential the hub cape are first removed

OR.

Unless a oar is more than one year it is not necessary to assume that the ferential needs overhauling. By jack one rear wheel and ro up one rear wheal and rocking it blick and forth, the total angenis of sleck in the differential may be estimated. It is also usually possible to reach the platens through openings in the differential shell, and by shaking them to determine whether they are loss. If yo, they should be rebushed and the plate or spilor re-placed at worm. Prespective posses are placed at worm. Prespective posses are placed at worm. Prespectively posses are placed in worm of the platent place of the contract of the platent placed in the platent place of the platent placed in the platent plate ing pinion or gear or both to compensate for wear If this adjustment is disturbed the gears should be moved in a straight the gears anouse he moves in a straight line and not canted ground, alse the teeth will engage only at their small or large ends instead of over their full length By rubbing red lead on the teeth and turn ing the gears, one can tell where the

teeth touch
if cup and come ball bearings are used
whether in the rear axis or in the transmission any worn parts should be renewed immediately Fig 7 shows the
effect of wear on a stationary ball come, effect of wear on a stationary ball come, o g on an axis spitable. The pressure comes against the stationary bottom por-tion and white the cup wears a true path the come is destroyed. It is possed ble though not always worth while to prolong the life of the cone by giring it a quarter or half turn on the shaft or axis. It is, our is stationary and the axie If the cup is stationary and the cone rotates evidently the cup will be the first to wear out of round When one ball of a set is renewed the entire set should be replaced with it

We come now to the engine the last we come now to the engine the last and in some ways the most difficult part to overhaul The owner is strongly ad vised not to attempt to refit the main vised not to attempt to refit the main crank shart bearings unies he has had considerable previous experience and shows exactly what to do not be other hand it is not at all hard to regrid and it is not at all hard to regrid and lifters and their guides and to do or dinary tinkering and adjusting with the timer arabrurer et al. It is best not to tamper with the magneto further than to clean the interrupter and adjust the interrupter collate joints if wors to fall small pear. This off the magneto first marking the coupling so that it can be replaced exactly as it was and tag the

be replaced exactly as it was and tas the no replaced exactly as it was, and tag the wires Remove and tag the oil pipes, blow through them to see that they are clear and plug them to exclude dirt Disconnect the carbureter remove the timer take out the spark plugs and plug the holes with waste remove the dust pan take out and mark the valves take off the water pipes, the pump, and the fan Now take off the cylinders If no further dismantling is contemplated the piston heads may be scraped in situ tak ing care that none of the carbon falls into the crank case and the piston rings are likewise cleaned without removal if ible If the rings are leaky as prove

possible if the rings are leaky as proved by failure to hold compression when the valves are tight new rings are put in and fitted to the locating plan which prevent them from terming. At the same time the outbon can be scraped from the in side of the cylinder heads.

Take down the oil pass Twet the fit of the virties plan and create plan bearings by one to be supported by the cylinder heads.

The form the plan is the contract plan bearings by the contract plan and create plan bearings on the plan. Do not confine a redding motion due to loose fit with and play on the plan A cortain amount of end play is always provided A creake pin bushings in likely to were contical (see shaded is always provided. A crain pin bushing is likely to wear control (see shaded area) if the rod is offset as in Fig. 8, and if the rod is springy the bushing may wear bell mouthed at both each. The crank pin itself will in time wear dar oranz pm reser will in time were that at the point of greatest presenting, as indi-cated in Fig. 9. It takes more skill than can be acquired off-hand to true it up again, but it can be done with a fine

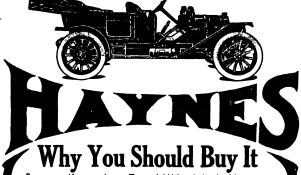

Swiss fits and calipers. It is not neces-sary to fits clear around the unworn por-tion of the pin, aince a slight devis-tion from its original axis does no harm, neither is it absolutely essential that it should have the same diameter through out. Its new axis, however, must be ab-solutely parallel to the shaft. It is best new, taking out or inserting shims till a fit is obtained, and scraping no more than is necessary. A worn wrist pir bushing must be renewed, and usually the wrist pin must be ground true II the crank pins are oiled through passages drilled in the crank shoft, their lubrica tion' is probably perfect. If, however they are olied solely by splash and the oil holes are in the upper half crank pin bushing, a considerable im-provement can be made by replacing the upper bushings with solid ones and in upper bushings with solid ones and in troducing the oil through the bottom half by brasing a copper tube in the cap to act as an oil scoop (Ng 10). The bot-tom half is then drilled and provided with an oil groove for about half its length it is a principle of tubrication that the oil should always be introduced. at the unloaded side of the journal and that any breaks in the continuity of loaded surface merely afford the oil an

To renew the ciutch leather, take off the old leather and use it as a pattern Select the new leather carefully for uni form and correct thickness, and cut it about half an inch short. The curvashout half an inch short ture should be approximately that of the old piece (Fig 11) Locate the end and the middle holes for the rivels countersinking them considerably so the rivet heads will not come flush, and soak the strip in water till it has swelled suf-ficiently to go in place. Use the end of a steel bar as an anvil, and put in the end and middle rivets first, holding the strip and gitture rivers min, notding the strip meanswhile by wire nails. The riveting must be completed before the strip dries

### AUTOMOBILE FIRE-ENGINES

(Continued from page 55) gine proper After reaching the fire engine proper After reaching the scene of the fire the driving gear is uncoupled and the pumps are put in con nection with the engines. Such fire en gines of course must draw their water gines of course must draw their water from a hydrant, well, or other supply They have done splendid work in au burbs wherever fire engines of suitable power or an adequate high-pressure sys-tem can be held in reserve The best a crew of seven men at speeds up to 60 miles por hour and carry 1,000 feet of nose The pumps deliver 700 gallons of water per minute at pressures up to 150 pounds to the square inch. The regular to the square inch steam fire engine has a capacity vary-ing from 400 gallons per minute to 1,000 gallons in the case of the largest size of machines. Such a motor fire engine usu-ally contains two 3-gallon chemical exmacrones. Such a motor are engine une-tinguishers, and heavy suction hose for hydrant connection, fire axes, nonsis-heders, large slarm belt, the usual equip-ment of famps, hancers, tools, and small saling ladders. In the opinion of many fire engineers a suburban fire station with possibly a some engine in reserve Again, ricam engines may also be bid at reserve stations instead of a large number of single steamers. This means considerable socomy in the purchase, optipment, and maintenance of a fire action and the posed of the nucleus ac-able efficient survive to be readered. Finally, we may consider machines in which no essential change is made in which no essential change is made in

their construction except to use the gr their construction except to use the gaso-line motor and means of propulsion in place of the usual horses. Typical of these are the large combination hose wagons and chemical engines which uses are the large combination hose wagons and chemical engines which carry 1,000 feet of 3½-inch fire hose and answer every purpose of the horse-firm wagons which they are destined to supplient. Fuel for 150 miles can be spirited in the gasoline tauths and spoofs.

Bryma an automobile as serious business. Thousands have deemed themselves the pleasare of motoring. They doubted the wasdom of buying an expensive care and would not take the rail of a cheep one. Perhaps and would not take the rail of a cheep one. Perhaps and would not take the rail of a cheep one. Perhaps built to sure years need. Our problem has to make just as good a car as could be built by the best switness, from only the heat sate fails. We wanted to spre you a car that you could be proused builden of langle-spread cars, the passes builted of the passes builted or the passes of the passe

are unexcelled by the highest priced foreign or domestic cars. It's just the car to meet your requirements and keep your interest. It has no hidden weaknesses no parts of un-known value. Every detail of its construction represents years of experiment and study, every

doubthil element has been discassed.

There is no economy a sacrifing enjoyment and comfort to saw a few hundred dollars in the purchase price.

A cheap car may look good, and do ats work well for a time, but it ceast least.

It costs mose to build a car that will stand the test year in and year out. There's bound to be skimping momenture in chasp car. That means touble for you sooner or later, and discontinued.

CLEANING THE OILING STREET it occasionally happens that the oiling system becomes clogged, either from the blokening of the oil or the introduction

of dirt and grit.

or art and grit.

In the majority of cases this may be cleared away by draining the oil from the tank and crank case, putting a pint or two of gasoline into the tank, and or two or gasonie into the gaso-line will thus be forced through all parts of the system, and will cut out the thick oil and dirt. Before redilling the tank with oil, the gasoline should be drained out and time allowed for it to drip out

CUTTING A GARRET

To prevent the leakage of oil the cover of a gear case usually rests on a gas ket, which may easily be injured or de stroyed when the cover is removed. Its shape makes it seem a difficult part to replace, but as a matter of fact it is a question of only a few minutes work to

The material to use is smooth and un creased brown wrapping paper of me-dium weight, and of a surface that is not too highly glazed Clean the top of the goar box and lay the paper over it, then with a light hammer tap the paper where it rests on the outer edge of the flat part. The edge cuts through the pa per where the hammer strikes, and to get the gasket to proper shape it is only necessary to follow the edge all around To prevent the slipping of the paper, the for prevent the suppling of the paper, the first step might well be to cut two both holes through it, and to insert the boils. The holes are cut by striking the paper over the both holes in the gear case, using the ball end of the hammer

The finside opening is cut in the same manner as the outside Before applying the gasket, give one side a coat of red lead and the other a coat of shellac, and in placing it in position have the shellac side down, or in contact with the sta-tionary part. The gasket will then cling and will not be torn on any subquent removal of the cover

A gasket made in this way will give excellent results under the detachab excellent results under the detachable head of a marine or stationary engine, but after fitting it the engine should be run sufficiently to get normally heated before finally setting up the nuts or belts that secure the head to the cylin-

Aside from its unsightliness, a dent in tube, radiator housing or other metal a tube, radiator housing or other metal part may interfere with operation, and it becomes necessary to remove it. To do this form one end of a plere of stout copyer wire into a loop, and soder it to the lowest point of the deat. Then exert a strong and steady pull on the wire, at when the same time dapping the borders of the deet with a light hammer. When the deet with a light hammer. LINING UP THE WHERE.

While it is not generally realised, yet while it is none the less true that the failure of tires to give good service is in many cases due to the wheels being out of line. This may be caused by misadjust-ment, sprung steering-rod or arms, a twist in the axie from road shocks, all of which result in throwing the whoels out of parallel with the center line of If the wheels are set correctly, they will have a true rolling motion on the road, and the slightest deviation from the road, and the slightest deviation from this position will set up an additional sliding action that is destructive to the

In testing the parallelism of the wi In testing the parameters of that the side it may be taken for granted that the side members of the frame, as well as the springs, are parallel Starting with a springs, are parallel Starting with a rear wheel, measurements should be made of the distances between the spr and the forward and rear portions of the fellos, at points as nearly as possi on the level of the axis These measure-ments should be equal, and should be the same as corresponding measurements made on the opposite side of the car if the figures indicate that the wheels are equally out of parallel with the springs.

equally out of parallel with the aprings, matters may be set right by making a proper adjustment of the radius rods. To test the from whoels, manipulate the steering gear until measurements show one wheel to be parallel to its spring, it will be necessary to adjust the drag link, which is the bar connecting the standard arms of the tray lamables. the steering arms of the two knuckles.

Another method of testing the wheels is to stretch a string along the sides of a front and rear wheel, just above the axle. With the steering gear set for straight running the string should touch each wheel at two points, as indicated in the diagram If the wheels are not true, the string will touch at one point only, as illustrated

The writer was once called on to lozaie a knock in an automobile engine belonging to a doctor There was no ques-tion as to the cylinder, nevertheless even the use of a stiff wire, one end held in the teeth and the other resting against the engine, failed to determine whether the trouble was in the crank pin or wrist

The sight of a stethoscope in the tor's pocket suggested its use, and the knock was immediately located in the knock was immediately located in the wrist pin. A stehencope now takes an important place in the writer's testing equipment, and he believes that it will be found invaluable in the repair shop by its use locensees in a bearing may be detected long before it becomes service, again again when the becomes service, again again was be should be a supported with the state of an intelligent was the state of the

## AWonderful Business Story

We have told in a book—which we ask you to send for—one of the greatest business stories ever told. A story of how John N. Willys stepped in two years to the topmost place in motordom. Of how Overland automobiles rose in 24 months to this year's sale of \$24,000,000. How a factory has grown like magic to a payroll of 4,000 men—to a daily output of 30 carloads of automobiles. And how a large part of the demand of the country has been centered around one remarkable car.

#### The Discovery

Here is an outline of the story—just enough to make you want it all

Two years ago, Mr John N Willys was a dealer in automobiles There came to him one day a remarkable car—evidently the creation of a mechanical genius. The simplest, sturdiest, smoothest-running car that anyone around there had seen

The name of the car was the Overland And the price—then \$1,250—was as amazing as the car itself

The sale of this car spread like wildfire Each car sold brought a call for twenty others like it. Old and new motor car owners came by the score to deposit advance money—attracted by the Overland's matchless simplicity

But the cars did not come And when Mr Willys went to the makers he found them on the verge of receivership.

The genus which had created this marvelous car could not finance the making, in the face of the 1907 panic.

#### The New Start

Mr Willys in some way met the overdue pay roll—took over the plant—and contrived to fill his customers' orders.

Then the cry came for more cars from every place where an Overland had been sold. As the new cars went out the demand became overwhelming. The factory capacity was outgrown in short order. Then tents were erected.

Another factory was acquired, then another, but the demand soon outgrew all three.

During the next fiscal year these factories sent out 4,075 Overland cars. Yet the demand was not half supplied.

Dealers fairly fought for preference. Buyers paid premiums. None could be content with a lesser car when he once saw the Overland

All this without advertising. About the only advertising the car ever had was what users told others

#### The Pope-Toledo Plant

Mr. Willys' next step was to buy the Pope-Toledo factory—one of the greatest automobile plants in the country. This gave him four well-equipped factories—just 16 months from his start.

But the Toledo plant wasn't sufficient So he gave his builders just 40 days to complete an addition larger than the original factory

Then he equipped these buildings with the most modern machinery—with every conceivable help and convenience—so that cars could be built here for less than anywhere else

Now 4,000 men work on Overland cars The output is valued at \$140,000 pxt day The contracts from dealers for this scason's delivery call for 20,000 cars

Now this man has acquired 23 acres around his Toledo plant And his purpose is to see from this time on—that those who want Overlands get them

#### Marvelous Sales

Dealers had ordered 16,000 of the 1910 Overland models before the first car was delivered. That means that each Overland sold the previous year had sold four others like it.

And without any advertising.

This year's Overland sales will exceed \$24,000,000. Yet the Overland is but two years old.

#### The \$1,000 Overland

This year an Overland—better than last year's \$1,250 car—is being sold for \$1,000 That is because the tremendous production has cut the cost 20 per cent.

A 25 horse-power car, capable of 50 miles an hour, for \$1,000, complete with lamps and magneto Never did a maker give nearly so much for the money.

There are higher-powered Overlands for \$1,250—\$1,400—\$1,500. They are just as cheap in comparison as the \$1,000 model

The Overlands are unique in simplicity They operate by pedal control A ten-yearold child can master the car in a moment

They are made in the same factory, and by the same men as made the Pope-Toledo—a \$4,250 car The reason for the price lies in the production of 125 cars per day

#### Get the Whole Story

Send me this coupon to get the whole story, told in a fascinating book Learn about the ear which in two years captured so large a share of the whole trade of the country. See what has done this—what there is in the Overland to make it the most desired ear in existence. Please cut out this coupon now.

gine until the platon is in this position,
and then adjust the tappet until the igniter just breaks contact and the beil niter just breaks contact and the on-stope ringing. To test, crank the en-gine until the piston again makes a compression stroke and the bell begins to ring Continue to crank, proceeding slowly, and observing the position of the piston by means of a wire passing the piston by means of a wire passing through a relief rock, or by marks on the flywheel The bill should stop ring-ing at the instant when the piston reaches its topmost point

#### LACING A PAN DELT

The requisites for joining tog ther the onds of a flat lacer bolt are rawhide lac ing % or % inch wide and a round punch of such size that it will cut a hole in which the lating will make a snug fit For a fan belt of average width three holes may be punched in each end, the outside holes % inch from the end and the center one & or % inch in, the holes in the two ends being in line. The holes in the two chas being in the relative positions of the holes in reshown in the diagram. The laving is passed through the holes in the manner indicated and drawn tight. To secure the end a cut is made on each edge of the lacing, extending inwardly for one-quar ter of the width, the knife being laid fint on the beit. The lacing is cut off 1/2 inch farther up. The end may then be flattened out, and the wings formed by cuts will prevent it from pulling through

The belt will stay in position only when the stitches in contact with the pulley are parallel to the pulley cike If the belt is placed on the pulley so that the slatting stitches are in contact with the pulley face it will lend to ride off

in an emergency heavy who picture cord of the ordinary stranded variety may be used in place of rawhide The only objection to its use is the click that it makes in coming in contact with the

RAPID MOTOR VEHICLE CO., 124 Rapid St., PONTIAC, MICH.

NOTE: We make Sight Seeing Cars of all styles and once, also Ausball Department Cars and Mestry Duty Trucks.

The Meterist's Legal Pyrodistic Are Solved by Color Linip is

For every motor vehicle need there is a Solar-and it's the quality lamp for the purpose. Solar quality persists throughout the line.

It is as strong in the smallest side and tail lamp as in the largest headlight.

Why take ordinary lamps when the manufacturer will furnish Solars if you insist? The manufacturer knows their value as well as you do, but they cost him a little more. They are built for your—not for him. Then there are Special, unique Solar Lamps for special needs of the Motorist.

There's the Solar combination gas and electric headlight-both illuminants interchangeable.

There's the Solar combination oil and electric side lamp, the only satisfactory solution of that end of the lighting problem There's the Solarchpse, the two-ray light projector, giving you in one lamp a search-light beam and a nearby illumination.

There's the Solar Raydeflector, and driving single-focus headlights out of use. rapidly

But send for our full descriptive catalog. It's free, and it's one of the most interesting booklets the motorist can read

Badger Brass Mfg. Co.

locate) between the covers.

FCAIR.—C. M. Bronnis, Birmingham, Ala.
The principal objects here are the provide a structure which may be readly extended, a structure wheth the moving parts are excurely and singly mounted, a structure having a multiplicity of carrying beams with a single adjusting missier, one wherein the platform may be supported upon end rule without interfering with the moving parts of the scale

propose

JOBES PAP BINDER.—J M. Lett., Watms. Wis. The invention relates to a special
force of binder for holding the sheet of loos
leaf books. Too patentee provides for each
group of leaves a novel force of simple
plates havine specially designed interiorking
plates havine specially designed interiorking
sings that clamp the plates together and ongapt the lawnes of the book.

Mandware,

Sending a message is only half of the transaction. The other, and equally important, half consists in getting back the answer.

Sometimes this is a reply to a question, or the acceptance or rejection of a proposal. Sometimes it is simply an acknowledgment that the message has been received.

The value of the message depends upon getting an answer.

When a general manager sends word to a representative in a distant city, he wants to know that his

#### ADAPTABILITY OF THE STROSCOPIC CAR TO RAILBOAD SERVICE

RENNAN and Scharl, each working indepen ently of the other, have recently proved that
a car containing a pair of gyroscopes can be
run upon a single rail and maintain its starur upon a single rull and maintain in small bility under varjug conditions of evestric loading, side winds, and curving track. Upon needing a prac-lical demonstration of this fact, and schooliting the car, as the writer recently did, to various sever and successfully-endered tends, tit is natural; in the first moment of enthunism to juredict an immediate and widelpread application of the system, or even than eventual? Shadedonment of the present two-rull track same winespreas application of the system, or even that we wentual shandomment of the present two-real track and tradits in favor of the monopail type. Soher second thought, however, must convitice any thoughtful and practical mind that, in spite of the brilliant results of the recent demonstration, the monoral syrescopic car, in the nature of things, can have only a more or less limited amplication under succeeding. more or less limited application under present-day conditions. We wish it to be distinctly understood, conditions. we wise a to be theretainly understood, of course, that any criticisms which follow are in no sense hostile, and are made with a full appreciation of the skill and knowledge, both theoretical and practices are the skill and knowledge, both theoretical and practices are the skill and knowledge, but the skill and knowledge to the skill and knowledge. tical, with which the car now being shown in this city has been developed THE CAR.—Mainly because of its perfect adaptability

to take the curves, whatever the degree of sharpness with a minimum risk of derailment, the promoters of the system claim that trains of this type will be run at speeds from fifty to one hundred per cent greater than those that are possible on two-rail track. Now if the new system is to compete with the old, the trains must provide at least the same capacity and comfort as the present Pullman trains it is stated that, in such cars, the weight of the gyroscopes will represent about 8 to 8 per cent of the weight of the car Structurally, the monorall car must be at least as strong, being supported, like the present type, on two points, namely, the centers of the two trucks. The trucks, however would be lightened by the reduction trucks, however would be lightened by the reduction of the number of wheels per truck from six to say four, and as the sailer would be shortened, it is probe bit that the weight ared in this way would be about equal to the si or 9 per cent represented by the weight of the gyraceopo mechanism Hence, it is not likely that there would be any reduction in the weight of the cars as whole The gyraceopt mechanism, on the the car as a whole The gyroscopic mechanism, on the therhand, would be an extra card and certainly not a very light one in the very nature of things, it must be most carcially constructed and of the very best material. The motion of the car would undoust-culy be easier. The aircrait awaying and shocks inci-dent to the present two-rail system would give place to a very greatin and probably impressystible rocking to a very gentic and probably imperceptible rocking motion, due to the controlling aution of the gyroscopes On the curves the riding of the new type would be greatly superior, the sudden joiting of the care against the outer rail, and the uncomfortable sway against the outer rail, and the uncomfortable sway ing of the passengers in the same direction when the cars are running at high speed would be entirely wanting except possibly on entering and leaving the currese Under the two-track system, the car is placed in a favorable position for entering the curve by the gradual elevation of the outside rail for a dista Fraulais elevation of the duting rain for a facabase of from 150 to 200 feet before the curve is reached, and also by laying out the first portion of the curve as a spiral with gradually decreasing radius. If some means can be found to throw the gyroscopic car slightly toward the inside of the curve before the last ter is reached, it would be advisable to incorporate it.

THE TRACE - Although the claim which is so frequently made that there would be a simplification of the track and it issueshing of his cost is justified by the facts, those detruntinges upoids not be so great at solid at first to happainsteed. One line of raths would be a first by his passed with a languabler, it is true; but the remaining with alterpated it is not be desired. In the spend is to be devised. In the first piace the concentrated weight on each set of wheals would have to be derised. In the first piace the track, outverte, bridges, etc., are directly related to the momentum, and the momentum interesses drive the track, outverte, bridges, etc., are directly related to the momentum, and the momentum tenerous drive that the first piace the track, outverte, bridges, etc., are directly related to the momentum, and the momentum tenerous drive that the fortamic arrivesses upon the rail, the control to the propellier is placed at the story of the velocity, it follows that the offers alignment, low joints, slight deviations are all the story of the velocity in the velocity is part which a start which a start which a start with a start. In it is doubtful he as exceedingly complex and obscure, and considerable the propellier and th In the case of long-span bridges, the concentration

in the case or long-span bridges, the concentration of the weight on the center of the floor would call for increased strength in the floor beams, although in the case of deck bridges where the floor is laid upon the top chards, the trusses or plate girders might be brought somewhat choser together. The cost of maintenance would undoubtedly be con-

The cost of maintenance would uncoupledly be con-siderably reduced, since the labor entailed it is beening two rails to gage and it maintaining the proper super-elevation of the outer rail on curves would be antirply eliminated. On the score of safety, provided a sub-ble form of track were built, the argument is entirely in favor of the groscopic car, and especially so on the

It seems to us that if there is a future for the new system, it will be found in the construction of pioneer railways through undeveloped country, and particu-larly through mountainous and hilly country where s must of necessity be very circuitous. solf-adjusting qualities of the car enable it to run solf-adjusting qualities of the car ceable it to ran around curves which would be altogether impossible for a two-track railroad. The monoreal track could be located around a bill or bild, through which a two-track railroad would have to pass with heavy and ex-pensive excavation Morover, for this class of rail-road a much lighter car would be practicable and ex-tremely high speeds would not be demanded. This decrease in weight and speed would mean a great re-duction to describe the control of the con-traction in the control of the con-traction. duction in first cost and subsequent cost of mainte-nance of the system If the new type should demon-strate in service of this kind its commercial practi bility, it is quite conceivable that it would be ually applied to the more important lines of travel, and eventually, to the main trunk roads.

### IMPORTANT INVESTIGATIONS REGARDING THE PROPERTY OF SHIPL

PROPERTY OF SELFA.

MPORTANT investigations, marking a new era in the study of the propulsion of ships, are about to be undertaken by the Naval Architecture Department of the Massachasetts Institute of Technology, under the direction of Prof. Cecil IR. Peshody; the head of the department, and a corps of sasjetants and resconting the property of the

associates
Already a navigable forty-foot model is in process
of construction, funds for the maintenance of this
work being provided by a friand of the department,
in order that the investigations may be of a prestrict
in order that the consoid with the actual conditions
of ahip propilation, the model is being patterned after
the U.S. S. "Stanting," and will be out on-orderith scale. the U S. S. "Manning," and will be on a cone-fifth scale. The choice of the "Manning" as a type of ship for the experiments is made because Prof Peabody, under whose direction the work is to be done, was directly connected with a remarkable series of speed trials on board the ship, which were reported to the Boolety of Naval Architects and Marine Engiaseers in 1989 After the relations between the actual trials of the ship and those of the narigable model have been extincted and the series of the ship and those of the narigable model have been extincted as the ship and those of the narigable model have been extincted as contains the same of the narigable model have been extincted as contains the same of the narigable model have been extincted.

lished, a certain basis or dearmination will be un-nished, by which it will be possible to determine what may be expected of a full-time ship, before the latter is built. The method which it is proposed using has been tried successfully in Great Britain to some extent, particularly for such types of vessels as the "Maure-spin" and "Lusitania."

takais and "Lustianias" Mesers. Denny Brothers of Dumbarios, Maghasi, have a private model basis in which they have dependent very confidence of allips, and in the case of the papers werend, the "Otakis" which was but by this size of the capacity and power of the near the destination, just such a narrigation model was need to determine the capacity and power of the nearly combinations of proposating anginess and lever-private trifficias. The department has been precision that the operation of the model hash at this Watshipton many year, daying preliminary topic age to be middle there with didn't the a

groups.

Upon the completion of experiments with the shells built and engined to correspond with the probletype, various forms and ionations of propellers will be problets, expendented upon, including twin and triple-screw propellers, especially of the type used at present with marine turbines. The form of the hall will highs be changed so far as may be without robuilding, and the affect of writes forms of slate will be built to extend that or various forms of slate will be built to extend Another important problem to be undertaken will be

the steering and maneuvering, including practical work in rough and stormy sees. As this field has re

work in rough and stormy seas. As this field has re-ceived but Hitte attention in the past, much new and viluable information will be acquired. Thus proposed method of investigation has the con-siderable advantage that a proposed design may be tried on a sparl and inexpessive scale simulating all the conditions of actual service, including the perform-ance of the ship under adverse weather conditions. After satisfactory conditions have been attained by use of the model, the dimensions and conditions can use of the model, the dimensions and conditions can be determined for the rull-sized ship by the theory of mechanical similitude. The fact that the theory leads to the assignment of somewhat higher power to the ship than may be needed gives the designer a

the ship than may be needed gives the designer a mergin that may be taken shrantage of, but which can be controlled by the preliminary experiments with a foll-sign ship for a prototype. The equipment: will be used quring the coming syring and summer by Frof Peabody and his col-leagues for original research. It is confidently as-pected, that results will be obtained which will clear pected that results will be obtained which will clear up certain decours places in the theoretical work and design of the students of the department. The train-ing received by the experimenters in the use of the equipment will thus form a part of the laboratory equipment of the department.

A simple method of clarifying the air of a room has recently been suggested. It consists of an elec-tric fan or ventilator, which is operated in a cylinder, and from a reservoir above the fan a liquid is al lowed to drop on the fan blades. This is thrown out against the cylinder in a spray, through which the air drawn by the ventilator must pass. This serves to collect the dust from the air. The inventor of this aystem proposed the use of giverine or scapsuds, but it has been found that practically as good results can be obtained by the use of water

se commed by the use of watching fish was described in a recent issue of the Electrical Review and Western Electrician. A trollay line running between Frank lin and Columbus, Ind., skirts the White River for a In and Columbia, ind, szirts the White River for a considerable distance, and it has been discovered that the trolley wire is frequently tapped to furnish cur-rent for fishing by electricity An end of the wire is placed in the water, and the current stuns such is piscoid in the water, and the current states such fishes as come within its influence, so that they can be taken out with scoop nets. The trolley company and the Indiana Fish and Game Wardon are trying to break up this method of fishing

The value of aluminium for the field coils of railotors has been tested in Germany It is found way motors has been tested in Germany It is found that the sluminum takes up less space than the cop-per, although a larger mass of metal is required. Se-cause no covering is required. The oxide film on the aluminium provides sufficient insulation and there is no danger of destroying or weakening this insulation by charring as in the case of the cotton covering when the motor is overheated so that there is less dan ger of short circuits. The principal advantage, how-ever, is in the reduced weight, as the sluminium colls weigh but half as much as the copper colls.

A writer in La Revue Electrique describes the ex-periments of Miroslaw Kerubaum to determine the ef-fect of ultraviolet light on liquids. He subjected about half an onnee of water to the rays of a quarts merhalf an other of water to the rays of a questi mor-cery vapor ham, and after about ten bours gas ap-ceptive and the second of the second of the hours also cable millimeters (0.016 cable tach) of gas was produced. The gas proved to be hydrogen, while the water showed that it was charged with orygen This experiment explaints the presence of oxygenated water in snow and rain. It is proposed to use this method for setroiling liquids, as oxygenated water is an excellent germicide.

How that serial navigation is coming to be or sidered seriously new problems are arising, such as the question of navigation on starless nights or over fog bound land, when the aeronaut will be unable to fog bound land, when the aeronant will be unable to find his bearings. It has been proposed by a German invasior that a network of wireless stations be-established over the land, each automatically seeding out a predetermined signal at requise intervals, which would be received by the air certs, and enable the aeronant to determine his course. The attractive would not be required to carry transmitting apparatus, as a small receiving apparatus would suffice to enable these to want themselves or the proposed represent, and there are well themselves or the device could entity be large down to a few possible.

One objection to glass roofs is that if they are not very steeply inclined, the water of condensation collects on their under surface, and instead of running down along the separating ribs of the panes or plates, and along the beparating rise of the panes or plates, and being led off, drips upon persons or objects below, which is inconvenient and may be very expensive Even where the panes or strips are short, the path to the trough is too long The increase in length and width of the plates now used makes this difficulty of width of the plates now used makes this difficulty of more and more importance each year. One way of getting around it is, however, similar to that employed in forests and parks to prevent washing away of the hillside paths, namely, making inclined grooves to ward the sides, only in this case the grooves are of horeschoe shape, and form a series of parallel corrupa-tions of the control of the control of the control of the internal control of the control of the control of the control in pales. Here then follow these the plate, they then follow these without much diffi-culty down the slant to the trough below. This system may be employed either with glass sheets in which wire is embedded or with plain plates.

We notice in a recent number of the Medical Record a letter from Dr Robert I Watkins, New York city, in which he claims the credit of having applied the movwhich as claims the credit of naving applied the moving pleture to the inferencepe. He states that as far back as 1897 he domonstrated the machine to a private audience, among whom was the Reliter of the Beign-Tifle Assignator. The machine, known as the "micro-motoscope," was described in our issue of July 31st, 1897 Later, microscopic moving pictures were exhi-ited at the Grand Central Palace during the Traine Nurses' and Pure Food Exhibition, the pictures thrown on the screen exhibiting the circulation of the blood in the web of a frog's foot, rotifers in stagmant water, an amedoid leucocyte, typhoid fever germs, and many others. Since that time Dr Watkins has greatly improved his rough apparatus, and gave a demonstration on June 17th last at Chicago before an audience of five hundred physicians of the National Eelectic Assomay venture to point out that Dr mandon employs not the ordinary mircroscope, but the

The third paper dealing with the results of the Smithsonian African expedition under Col Theodore Roosevelt has just been issued by the Smithsonian Institution It describes a new species of Octoores to which the specific name of pirguiss is given to which the specific name of virgulus is given. This new animal is a small carnivorous mamnial closely resembling a for. It is generally buff in color, and it has been found by Mr. Gerrit Miller of the museum. staff to differ slightly from Octocyon megalotis, which occurs farther south, especially in color and in the characteristics of its teeth and skull. The octocyon is peculiar to Africa, and is not represented in the United States, but resembles in color the swift or kit fox of the western plains. The skull of this new form closely resembles that of the gray fox of our native fauna. This announcement is of special interest for n that comparatively few new forms were expected from this region in Africa as the territory up to this time explored by the Smithsonian African expedition has been pretty thoroughly examined by British naturalists.

The water bottle for gotting water for analysis from selected depths in the coxen is a cylinder of brass. German silver, or other metal which resides the corrosion of see water, generally about two inches in diameter and twister or fourteen inches long, with upwardopening valves at the top and bottom, connected occupant of the control size. It is not the side of the control size in Long are cast on the side together on a central stem. Lugs are cast on the side of the cyllinder for conveniently securing it at any point along the length of the line by which it is to be revened into the security of the time by which it is to be compared to the contract of the security of the sage of the water through the cylinder during its de-sent, but, when the motion is reversed, the waters seat themselves and are locked by the descent of a small propeller in the framework above the upper small propeller in the framework above the upper valve, which rides tilly on a sleved during the lowering of the bottle, but descends along a serve thread to press the valves tope their easts when the line com-mences to be basied up. A specimen of the vater at the depth to which the water bottle has descended in this brought to the surface confined within the bottle, and a series of specimens from different depths may be obtained at one head by securing a series of water bottles at the required intervals along the sometime

## THE SCHERL GYROSCOPIC MONORALE

THE PRINCIPLE OF ITS OPERATION

Within the past few months Mr Brennan has ex bibited at London a car whi h runs upon a single rall and is prevented from fail ng over to either side by the resistan c of two gyros of es carr ed on the car At about the same lime Mr S herl a German capital lat exhibited in Berlin a similar ar B tl cars were

The gyroscopic car inclines automatically to the inside of a curve

ried their loads successfully and in on h ase the gyroscopes maintained the car in a state of equilibrium—and they did this even when all the load was placed to one side of the car or when the car was running around a urve

Apparently the inventors worked quite independently apparently the inventors worse quite independently of each other and it is a remarkable fact that in the essential elements for the control of the gyroscopic, mechanism they should have produced machines so broadly identical. The Grman car which is now be ing exhibited in this city represents the joint labors of Mr Ia i Froeli h the inventor who worked out

tions per minute. We are all familiar with the gyro-scope of the toy shops or the lacture room—the first mountard rotatably in one the second in two encom passing rings with the axes of the rings at right augles to each other and the figwheel axis in each case capable of universal angular motion. In the ac-

case capable of universal saguiar motion in the so-companying engraring we show a gymesope mounted as in the Scheri car. The gywheel is car ried on a vertical saids which is mounted in a gimbal ring. This ring swings on a bord total posts mounted on a beard total posts mounted on a beard will consider to represent the dack

which, for the present purpose we will consider to represent the dock of the car. If we change the plane for rotation of the flywebs present good on the flywebs present good on the state of the present good on the state of the good of plane at right angles to the plane in which we have depressed the

This tilting of the axis is known as its precession If now we en deavor to increase the precession by pressing down upon the already tilted axis the latter will resist

v ry strongly and there will be developed at the same time a large additional resistance to our depression of the side B of the board. It is in this advancement of the pre-ssion as Brennan alls it though the pre-cession be assed of the vigorous resistance of the fly wheel axis is not actually advanced) that the secret of the successful gyroscopic car lies as will be evident from the following des ription of the onstruction and operation of the Scheri car

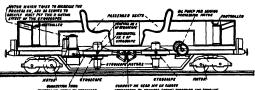

Referring to the engraving showing a longitudinal section it will be seen that the car which is 4 feet wide by 18 feet long is carried on two 2 wheeled

completely incises both motors and flywicels will the gyroscopes run in a perfect vacuum—this to avell the skin friction of the air which would retard the speed The caning are mounted on transverse axes just haled in the frame of the car and they are theighten hated in the frame of the ear and they are thoughten free to rook in a fore-end-art direction. The binguistic between the motor and the casing is so small tight the hast of the motors can i many the insciniting spik had radiate away freely and "heating up is therethy avoided. The speed of rotation of the 128-possis fly wheels as we have stated above, is 2 000 per phenois.

With three men on one side, car tilts to opposite side, restoring equilibrium

The rocking of the gyroscopes is in opposite directions—if the car is titled to one side they rock toward each other and sole overse and to insure simultaneous and equal movement they are connected together by best crank levers and two toothed quadrants as sh crank levers and two toothed quadrants as snown in the drawing In front of the gyraceopes is an electri-ally driven oil pump for generating hydraulic pres-sure to drive a precession motor which is carried at the rear of the gyraceopes. The precession motor one sists of a cylinder and piston controlled by suitable valves. These valves are themselves operated by the rocking movements of the gyroscopes and the move-

Longitudinal secti a through Neberl gyrostatic car

the theory and data for the design Mr Rmill Palake who designed and constructed the car and Mr Scherl the owner of the patents
Tar Otress ora—The simple groscope consists of a stylend to mounted upon a system of bearings it at its axis may be titted in any direction. The pe ultar and most interesting behavior of the groscope in the tot it fact that who as flywheel so mounted is rotat town to the contract of the to tre met that win h a nywhest so mounted is routing in a given plane it resists any effort to change its lane of rotation by til ing the axis on which it is turning. The tendency of the flywheel to maintain its plane of rota ion and is resistance to any force tend

ing to til it out of that plane is proportional to its momentum and since momen tum in reases di rectly as the weight and as the square of the tomary to use as small a weight d as high a ve and as possible dence the fly is heels used in the Scherl car weigh only 125 pounds each but they rotate at the swiveling trucks placed centrally below the longitudinal axis of the car—It is driven by two % horse power motors one on each truck—At each and is a controller and a box containing various operating switches In the center are two seats accommodating four passen

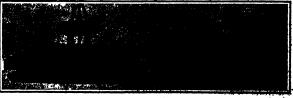

Mounted in the car frame underseath the s Mounted in the car frame underneath the seats are two gyroscopes one of which rotates lockwise the other anti-clockwise. The flywheels rotate normally in a horizontal plane on vertical axes. On the lower sad of each axis is mounted an electric motor. The axes are journated in atrong steel airtight casings which

memoral equilibrium is restored.
Another of our photographic views shows the striklag subscenses of a cer running around a curve upon
a single rail and inclining inwardly to the proper de gree to sanistatin its equilibrium. To practical railread
meet this is oversized the most attractive feature of the investions for it would mean the elimination of all the difficult outerallotory and acquarter problems. cted with the super-elevation of the outside rail se present two-rail tracks. It is a fact that the on the pr car is so intelligent (we cannot help using the term) car is so intentions (we cannot not pusing ine term) that whether the curve be easy or sharp and whether the car rounds it at ten or seventy five miles an hour it will lean inwardly with mathematical certainty to the exact amount required by its speed and the sharp

as of the curve
In the standard system of track the compos mtrifugal force tending to hurl the car over to the outside of the curve or cause it to jump the track is souslined by elevating the outside rail until the re nt of gravity and centrifugal force falls normally a track This condition (an only hold true on any to the track to the track This condition can only hold true on any given curre for a certain speed Below that speed a train will grind on the lower rail above it will crowd against the outer rail Not so with the gyroscopic car As soon as it enters a curve the pull of centrifu

car As soon as it enters a curre the pull of restrictly again frome is resisted and the gyrecropes draw the car over to the inside of the rail until the resultant or all the forces acting upon it passes intrough the rail The gyreccopic car as above described is one of the most brilliant investions of this or any ages But is it practical and will it pay? A discussion of this quest that will be found in our wildrail columns.

#### THE DEATH OF LEGS DELAGRANGE

After making a wonderful new record of 14s miles in 2 hours and 31 minutes on December 30th with a Bleriot monoplane Leon Delagrange who with Heary Farman was the first aviator to make flights with the crude Voisin biplane in France in the spring of 1907 crusts Yosin biplane in France in the spring of 150° met his death by a fall with the same monoplane on January 4th while dying at Bordesau. Our photograph shows M Bleriot with Delagrange standing at his left and Le Blane another daring pilot of the Bleriot machine at his right. Behind the three mentands the machine which is like that Bleriot used in creasing the Channel and which Delagrange used on the day of the accident A rather strong with we believe and according to colde resports when the machine headed into the wind the right wing souther headed the companies self to the ground

This is the first accident which his occurred owing to the collapse of an aeroplane when in the air We understand, however that some time ago a similar accident happened to Latham, but without disastross results. One wing of his Antoinette mononiana broke results. One wing of his Antoinette monopiane preze off and stood almost at right angles to the other wing yet by leaning to one side and warping the remain ing wing, Latham was able to guide his machine down in circles and bring it safely to the ground After repairing the wing he attached it in such a

BLERIOT AND HIS TWO PILOTS IN FRONT OF HIS NO 11 TYPE MONOPLANE

way that when he was up in the air he could oull a way tast waten no was up in to sair ne could puil a cord and cause the wing to break off as before He did this and tame down a second time with the wing broken simply to demonstrate that a broken wing did not necessarily mean disaster in the Antoinctte ma chine the wings are secured separately to a mast so that the breaking of one does not affect the other. In the Bleriot monoplane the wings are connected to-gether over a tripod the result being that if one breaks the other collapses and the machine is sure to be dashed to the ground

The death of Delagrange will put a damper upon the arder of some enthusiasts for a time but it was due to one of those unfortunate accidents which are siways liable to occur in the development of a new His name will go down to history as or martyra of serial navigation. He is the fourth aviator to be killed within the past four months the others be ing Lefebvre (who plunged to earth in his Wright machine) Capt Ferber (who struck the ground when making a turn in his Voisin) and the Spanish tailor Fernandes (whose small hiplane resombling the Cur tiss broke while he was making one of his first flights on December 6th last) All four fatal accidents

A NEW REGLISH TRIPLANS
Illustrations shows the new triplane One of our illustrations shows the new triplane of Mr A V Roe Mr Roe is one of the most persistent English experimentors. He has been working a long time and has finally developed a successful machine time and has many developed a successful machine little this discussion is really a Langley type machine in triplicate since it has three superposed surfaces forming a tail and attached like the forward planes to a tri angular body. The motor is mounted in the body at the front end of the machine and drives a three

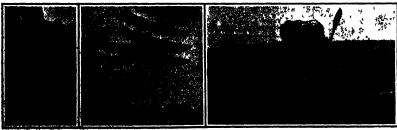

bladed propeller mounted upon its createstaft. The aviator sits in the body about half way between the main planes and the following planes or tail. The machine is mounted upon two wheels at the frost and a skid at the rear It is 23 feet long and the planes a shid at the rest. It is 33 feet long and the planes have a spread of 10 feet and 130 quarter fact of supporting surface of They are set at an angle of five degrees. The forward planes are 30 feet by 3 feet 7 inches while the rear planes are 10 feet by 3 feet 7 inches in size The total weight of the machine originally with a 10 horse-power Jap motor was but 200 pounds. A larger motor of 30 horse-power has been fitted The weight has been considerably in creased. The body is made of sold wood 11 in covered with cotton off paper becked with mealin The created the set of the set

Mr Roe has done most of his exper Wembley Park and recently the grounds have been enlarged there so as to give him more room. He has made a considerable number of short flights in a straight line and his machine is remarkable low power light weight and small spread

#### AVIATORS CONTURNS AND A MAGNING FOR TRACKING REGISTERS.

Two of the photographs reproduced on this page give a very good idea of the costumes worn by French aviators and of the dress soon to be adopted in France by the lady operators or aviatres The costum used by the men consist of overalls and immor and a light fitting skull (a) ompletely covering the head The contume being used by the lady operators con sists of a loose blouse and long bloomers extending to The contume using used by the lady operators con-sists of a loose blouse and long bloomers extending to the tops of the shoes. A skull cap similar to that used by the men is also worn. At the present time but two ladies have made flights by themselves in zero-planes in France. These are the Barroness de la Roche planes in France These are the Raroness de la Roche who operates a Volsin biplane and who recently met with an actidant by running into a tree and Mine Marvingst who is the first woman in the world to Mine flows a monoplane She has made saveral second lights with a Flaurich machine A number of solid lights a wine Flaurich machine A number of called and learning however and several aviation actions are learning however and several aviation action have been formed for women One of the machine tracestic organized of these was formed at Los An evidence, as a several aviation of these was formed at Los An evidence, as a several aviation of these was formed at Los An evidence, as a several aviation of these was formed at Los An evidence, as a several aviation of the sev geles (al

Another interesting licture at the bottom of this lage shows a novel training machine for accustoming aviators to a monoplane of the Santos Dumont type This markine consists of a substablial triangular body mounted upon three wheels and terminating in a tail mounted upon three wasers and terminating in a tail having movable vertical and horizontal surfaces by which the machine is steered to right and left whan running along on the ground or by which the tail is made to rise a short distance in the air. The two bottom members of the triangular frame are extended forward and meet above a small wheel five or six feet forward and meet above a small wheel ave of his res-ablend of the main wheels so that if the mach line the forward when the tail rises the front which keeps it from the ling too far. A four-cylinder water-cooled motor of 40 horse-power is mounted upon a U shaped frame and varies "propeller in front on its trank shaft. The would be aviator sits in a small seat below the motor with the control levers conveniently at hand. The machine is fitted with large wire whoels fitted with large diameter | noumat o ti utest with sarge manner; pounds of the Wil has marbine a beginner can irravi at very fast speed over the ground and accustom bimself to the steering side ways and up and down of a monoplane. The machine should serve a useful purpose in training aviators who intend to fly this type of acroplane

Marin triplano in Micht.

HE PRINCIPLE AND A PRESCRI MANIFER FOR TRACEISS HEW AVIATION. A SHIP A . . 18

#### Scientific Americani

A NOWIN-DELYMIN SAW,

The continuously running flexible saw is by no means a novelty to our readers. Its leading principles are embodied in the hand saws now in cotanous, although effective for sawing lumber band saws learned and control of the sawing lumber band saws. are incapable of cross-cut sawing on large trees is the forest because the band necessarily runs in two planes. For the purpose of overcoming this objection Mr R L Muir has perfected a new style of endless cross-cut saw which is flexible in a single plane of crossect saw which is fessible in a single plane of motion and which is carried in a frame which with the idle side of the saw follows the saw-cut through the long the frame being sufficiently stiff and rigid to keep the saw in perfect line The frame in question 1 is made of thin steel with groome degree Projecting brackets 2 and 6 are boiled to the ords in the brackets guide wheels 2 and 4

with grooved peripheries are journaled. The bracket 5 has a handle by which the operator controls the 5 has a handle by which the operator controls the new An endiese chain composed of saw likes 6 is mounted on the guide wheels and runs on the straight degas of the frame. The guide wheels on the frame serve to keep the chain straight during operation. This frame and the toothed chain constitute an end less saw which runs continuously and with makes a single saw cut in the plane of its motion. The saw moreover is adapted to all kinds and styles of saw moreover is some place to an amount and so, we one when for which (there circular saws band saws or mechan ically driven re hyrocating saws can be used and for which hand saws are ordinarily employed the two handled cross cut saw being a familiar example

The chain saw is driven by a gasoline or electric The chain saw is driven by a gasonine or securior motor the inner guide wheel being gaared up with the motor shaft as indicated in our front page illustration. The motor is carried on a skid which skid is moved along on ways whenever a new cut is to be

Mr Muir has carried on extensive trials w Mr Hull' has carried on oxensive trans with the saw in the vast redwood belts of Mendocino and Hum boldt Counties in California with remarkable success The most important advantage of his construction is that of the speed. One of his large saws it is as serted will cut through a tree having a diameter of t in less than ten minutes B the old and slow hand process this same work wo ime an hour and a half with two mon wielding aw One of the machine saws will accomplish as much as from 25 to 30 expert sawyers a wonderful saving in time and expense when it is considered that only two or three men are needed to operate a ma only two or three men are needed to operate a ma-chine. The sava can be run horizontally vertically or on an incitine. Trees can be saved within a few inches of the ground—a great arring thus being of fected in stump weats. In feiling trees of immonate also by the slove chopping methods hundreds of feet of valuable timber are lost by chippage because it is often necessary to cut up as high as eight feet we the level of the stump. The mechanical saw eribed avoids much of this waste

#### AN ELECTRIC PERFORATING PEN

Though various efforts have been made from time time to evolve an electrical system of securing an

Thougas recovered to time to evolve an electrical system or as indefilible writing r cord which is complete proof against both forgery and fraud such devices have proved commercially in practicable A Parsee inventor however Dr Dinash P Ghadiall has covieved a comparating which is very efficient. It Dr Dinahah P Ghadiali has evolved a simple apparatus which is very efficient. It is called the antiforge pen which as its name implies is to render forgery impos-sible. The writing is made up of a series stole the writing is made up of a saries of perforations burned in the paper The apparatus comprises a small box with a sloping lid measuring about 20 inches long by some 16 inches wide. The whole of the by some is increased and The whole of the electrical equipment is carried within the box or deak the lid of which is glassed and carries at is upper end a sheet of aluminium The pen itself is of the ordinary stylographic type

requisite current is drawn from a small f ampere storage battery as shown at A in one of the illustrations. The bat-tery is connected up in the usual manner to an induction coil B to which is fitted a small high-speed trembler capable of ad a small high-spe justment by a thumb-screw on the outside of the deak Between the secondary term

the coil a small cylindrical condenser C is placed in r to increase the intensity and fatness of the

In an electric system of writing care must be taken to prevent the inside of such letters as o d r and so forth from dropping out which would result if the outline were continuous. This possibility is obviated by means of the tremlier cell which makes the current rapidly intermittent. At the same time however such rapidly succeeding waves of electrical energy rising up to 10 000 volts instantly followed by a drop impose a severe strain upon the induction coll,

and will in time seriously affect it. To gence appears such a result the investor has interestent a novel tie-rice which may be beet described as a safety valyle to the cold. This is a highly enhanted recovers using, D which is also placed between the secondary termi-nais and which is in parallel with the pen if This saleric busines or vensum tube acts as bulbed food to the passage of the electric current through the pen is taken up thereby cassing it to glow brilliantly all the same time it also acts as a galvanometer as before writing the operator simily pressee the pen special gainst the deak, and the resultant glow in the vacuum

Specimen of writing with the electric pen-

tube indicates that the apparatus is working efficiently.

The pen is about the same length as the ordinary fountain per and its barrel contains a mercury break. The connection with the coil is effected by a short The connection with the coil is effected by a short-legath of facilities wire carried on a spring harrel. By means of the mercury break contained in the harrel the primary circuit is never closed until the pen is held in the normal writing position. From them, the current cannot flow to the point of the pen because the cone shaped extremity carrying the metallic writ-ing point is aspeared from the barrel connection of a spring plate in expansive from the barrel connection point is present quot the paper whepeth the metallic extremity is pushed inward against the metallic extremity is pushed inward against the accuract and now to the new notes.

extromity is pushed inward against the mercury that the current can flow to the pen point. To use the pen the sheet of paper is laid upon the aluminium pad which on its under side is connected to the secondary terminal of the induction coil by to the secondary ferminal of the induction cell by means of a flat spring. When the point is pressed hard against the paper and the electrical circuit is compleid the resultant spark burns its way directly through the paper leaving behind a distinct perfora-tion. The sire of the hole thus produced can be value as desired from a large coarse perforation to a small almost invisible pin prick by the adjustment of a rheestat, the knob of which projects from the left hand effect the second products of the projects from the left hand side of the desk

metallic point only the perform of the writing is produced but it may be desired to secure a legible distinct surface inscription as well In this case the metallic point is replaced by a small imms gramme. We gramme to district the district to the rests this region the page which the law of the protestancy, call they are presented as consequently account of the protestancy o upon The current will burn its way through the whole mass of spaces to that the signature is writing shull assessed on each and in period diplication. Occasequantly it is absolutely impossible involution to withdraw one about and insert another with an aignature, for it is only to another of counting the small bar of dots or perforation marks in the aignature on each sheet, and that which differe from the rest is obviously suprison at many as eight absels can be perforated by the pra as a time.

#### The Payrell of the Havy.

To provide for the welfare and comfact of the offi-oers and emisted men of the navy during the faral year of 1911 it is going to cost Uncle Sam just \$5 767, 417 Of this amount over \$5 000 000 will be spent to buy food for the 46 480 emisted men. The Navy Deonly most for the 2 see cannot meet. The Newly Di-partment figures that it could the government \$1.00 a year to feed each man, or just \$0 a month. The pay-year to feed each man, or just \$0 a month. The pay-year foil of the sellated men in the nany during \$151 will aggregate nearly \$12.000,000. This sum will take care of 41.725 in the general service \$44 men in the lausier force and 1.125 prisoners under sentence by court martial

About one-fourth of the men serving in the navy to day have re-culisted Of the 43 333 allowed by law 11 681 men are estimated as under re-enlist 11 871 men are estimated as under re-milistenet and entitled to participate in the allowances for reen listment and continuous service. These figures do not take into consideration the 1500 or more apprections. Based on the men in the service in June last the saverage pay of the sullisted men was 185 75 a meents. The perquisitors allowed officers in the nary will ap-gregate nearly three-quarters of a million dollars in

gregate nearly three-quarters of a million dollars in 1911 Of this amount \$144.469 will be spen: in provid-ing heat and light. The heaviest cost in the allow axone granated the nearl officers in addition to their pay is in the matter of quarters for those who can not be accommodated in buildings or houses main-tained by the government. The communition of quar-ters will aggress the 1815 100 while the communitation of the care will aggress the 1815 100 while the communitation of ns figured at 30 cents a day will reach a total

JOHN M BURNOP

#### SIGNTING A RIPLE. To the Editor of the SCHENTIFE AMER

To the Billior of the SCHOWLYD AREBORA.

Brevy marksman is familiar with the effect of raising or lowering the rear sight on his rife. Perhaps on the commonly understood it is the effect of raising or lowering both front and rear sights simultaneously on point-blanks range the target front and rear correctly pointed the trajectory of the builet is correctly pointed The trajectory of the builet is accurate intersecting this straight lime in two points one of which is the center of the target. It therefore on range there is another range for which it is equally correct and it is the purpose of this article to show rowth a ranging the elevation of both front and rear sights

The most accurate shooting is done with 0 12-caliber The most accurate absorting is done with 0 32-caliber rifes at ranges of from 15 to 50 yards and when once the sights are correctly set for one range no marks man likes to change them 1t may therefore be of interest to how how they may be set for correct work at two ranges which may be a considerable distance.

apar.

The path of a projectile is occuo is a parabola and since air resistance may be neglected for very short ranges and low velocities the parabola equation will be correct enough for our purposes. The equation is unually stated thus

w is the distance from the line of sights to the center y is the currence from the line of signits to the center of the gun barrel r the range g the acceleration of gravitation and s the angle between the line of sights and the center line of the gun barrel. The re-lation of those quantities is all shown in exaggerated dotail in the diagram

Since the angle a will be quite small for short ranges we may replace too a with unity which is ; ractically its equivalent thus simplifying the equation. This

Taking data from a Winchestor 0.22 rifle equipped with globe sights and sighted for 70 feet we have  $y \approx 0.05$  inch  $\approx 0.0468$  feet  $v \approx 1.000$  fort per se

Reducing to the form  $s^a + -s + -$ -=0 in whi h the 4

product of the roots equals the third term we have

$$a^{\mu} = \left(\frac{1(00^{4} \tan a)}{16 \cdot 1} x + \frac{100(^{4} + 10)}{16 \cdot 1} + \frac{100(^{4} + 10)}{16 \cdot 10} + \frac{100(^{4} + 10)}{16$$

Calling the roots s and z, z z,=-- 0 04**6**8 161 1 000\*

1 000

Thus when one range is 75 feet the other is 39 feet opicion is toe close to be of any use. We are also that the 75-frot range is on the falling side of the curve so that a Mittle greater distance will land the belief

low the mark To bring e, on the farther side of e, it is evidently necessary that y must be increased or in other words both the front and rear sights of the rifle must be al-

We will now find the value of y so that the gun will shoot correctly at both 7" and 150 feet As before

$$a^{\alpha} - \left(\frac{1000^{\alpha}}{161} \tan \alpha\right) \alpha + \frac{1000^{\alpha}}{161} y = 0$$
 (8)
Taking the product of the roots equal to the third

Thus by setting the front sight 3.17 inches above the caster of the hors and elevating the rear sight till the gas aboots correctly at 7 feet it will be from Apic elevating the raw sight till the gas aboots correctly at 7 feet it will be from Apic elevate at 150 feet. Moreover it may be shown that the property of the

sights may also be determined from the equation but it is much easier to get this angle right by means of trial phote, as it is very small and difficult to meas-ure Its determination is as follows in equation (3) the sum of the roots equals the coefficient of e with its

Of course all the above results are based on the assumption that the valority is 1 000 feet per second which is about correct for a 0 J short cartridge Be-

low is given a table in which the values of y aro worked out for other velocities and ranges. Air resistance which causes the projectile to depart from a parabolic path will have the general effect of causing the tabular values of y to be too low but this effect is not very noticeable for the short ranges and low velocities which are common in 0 22 calibor marks

vanits are not intended to as ply to high power rifies and long ranges although the departure of the projectile from a parabolic path does not alter the fact that any rifie may be correctly sighted for any two ranges within its limit

The Light of the Pirofy

After r ferring to the original work of Profs Lang ey and Berry and describing accurately their methods of investigation Dr H B Ives and W W (objects draw from their wn investigations the following very interesting enclusi n as to the relative efficiencies of the light of the firefly and that of incandescent electrk jamps

fillen y of the light of the carbon filament lamp is 0.43 per cont in other words of all the energy on a med only 0.43 per c at is converted int light The tungsten lamp has an eff in sy of 1.3 per cont and the mercury ar 38 per cent. The efficiency of the light of the fireft is 16 per ont. Making the comparison in another form the arbon filament lamp comparison in another form the aroon number tamp has an efficiency of 83 and the per mean themspherical candid the tingsten lant 10 per candle and the metallic are of walt per candle. In comparison with these the fields has an efficiency of 002 waits per candle.

ing. The subaqueous work was accomplished by means of diving bells. Most of these had an internal measurement of 11% feet by 10 feet and 4% reternal measurement of 11% feet by 10 feet and 4% feet headeroom with a weight of 35 tons when out of water and about 5 tons when submorged. They were fitted with 5 tons when submorged. They were fitted with either left lighting. The ness hed was first cleared by such the lighting free feet of the grade accurators to within about 15 inches of the regulation level. Then the diving bell descended and the men within completed the work and excavators to the chant 3 feet below the level for the foundations of the chant 3 feet below the level for the foundations of ic about 3 feet below the level for the foundations of to about 2 reasons the sever rity of the scour the superstructure. Owing to the sever rity of the scour and tidal action the foot of the breakwater on its outer lace is protected by a masonry apron about 25 feet in width built up of concrete blocks ranging from 9 to which built up of concrete blocks ranging from 8 to 4 tons in weight and 8 feet 6 in line deep. The bed for the aprox was excavated to a depth of 2 feet by divers. From foundation level up to low water the blocks are brief 4 together by varying the length of the blocks and are develed in the vertical ploins with 4 to 1 concrete sammes dowels of circular section. Above low water the courses are bedded and grouted in 2 to 1 cement mortar while the outside blocks above this point are faced with granite the stones being well onded into the concrete matrix

The reclaimed area lies at the foot of the cliffs and The reciaimon area lies at the tool of the citims and has a length of 2 300 feet by a maximum width of 350 feet the space being some 22 areas. On this expanse it is intended to creet the various buildings required for repairs stores and so forth as well as two protor repairs stores and so form as well as two pro-tected reservoirs for the storage of gasoline for sub-markers a station and depot for which is to be estab-lished her. The essatem arm projects seward from the eastern extremity of this reclaimed area in a south erly direction for 2942 feet. The construction of the southern breakwater was among the most difficult of

taking owing to its exposed position and the great depth of The average depth on this section of the foundations be low low spring tides was about 47 feet the was about 47 recogratest depth being 58 feet Work was gust 1904 and by De rember of the same year 480 feet of foun dations was complet ed and the masonry brought up to the level of low water When the extension had been completed and the plant there need was transferred to the island section work was maintained pressure 2000 feet of foundations bein=

completed in a year while in two months alone 114 blocks were set in position

The width of the structures at foundation level The width of the structure at foundation level ranges between 62 and 77 feet. In the case of the sast orn arm the width at deck level is 47% feet while that of the southern breakwater is 40 feet and the Admi ratity pier extension 45 feet in all cases the height of the deck level above high water spring tides is the

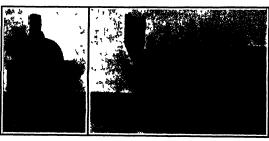

of the deck level above high water upring tides is the man wit a 10 few of the existing Admirably with reas-commenced that the testing Admirably with reas-commenced that the 1890. This arm was to be don-bled in length that is to 4000 feet and in this case owing to the existence of a revolving gun turrer on the old pier head which it was do tided to retain the pier hald to be widened for a distance of some 800 feet in order to permit it o raticost threats serving the steam shin berths to be laid

Both the western and eastern piers are provided with a parapet 11 fect and 10 feet wide respectively the top of the former being 43%, and that if the latter 39 feet above low water — The deck of the south break r however is quite level though similar pro-

vision can bere be made if and when desired.
The works have given employment to from 1600 to
1800 men and consid ring its character the accidents
and fashittles have been insignificant. No deaths or
permanent injuries were recorded in consection with
working in compressed air citizen in the titing bulls
or diving drasses. During construction neveral sent
ing locidents occurred. While the south breakwater
was under construction the liner "houstechhand man
into it seriously drassaria its stem and removerar a into it seriously damaging its stem and removing a mass of masonry. As a result at veral blocks had to be removed and reset. To carry out this work as in gratious hydraulic ram was especially evolved compris-ing a horizontal cylinder having vertical rams capable of exerting a lift of 180 tons by mohan, of which the

blocks were lifted so as to be gripped by the Gold cranes and then reset. On another occasion a ve-while entering the harbor found the timber stellar The collision was so violent that the two starks "ranes were carried away and considerable date rance were carried away and considerable skin nilicted Severe delays cocurred through gales, consequence of the exposed character of the positive full force of the southwesterly and easierly sto was experienced the waves sweeping over the wor Owing to the elaborate precautions adopted however Uving to the elaborate precautions adopted nowwer no valuable plant was lest though at times the heavy staging showed striking evidences of the battering by wind and wave It may be mentioned that the quan-tity of water required during an ordinary agring tide and which flows through the two entrances is 17000

A NOVEL BOLLER AND FURNAGE CONSTRUCTION The furnace and boiler illustrated in the accompa The formace and boller illustrated in the accompany ing engraving possess many decidedly novel teatures which nevertheless have proved efficient in practice. The grains of the furnace is enured up at each ride of the boller as that the forward part of the boller is half submerged in the foul which comes in direct contact with the boller ishell. The fire burns it way up through the coal which as it is consumed feeds downward from opposite submerged in the will be will be the sa downward farth through the coal while there is a downward farth through the coal which carries the gases to the bottom of the furnace and here they combine with air that passes through and nere they combine with air that passes through admissions at each side of the sab pit and flows be tween the grate bars up through the incandescent fuel The burning sases then flow through a nar row neck into a corrugated flue of large diameter which conducts them to the rear end of the boiler after which they pass through the boiler tubes to the

Front elevation and longitudinal section abowing the curved grate and interior details of the boiler.

#### A HOVEL BOILER AND FURNAGE CONSTRUCTION

stack Great care is taken to proportion the stack to the surface area of the tubes and flue so that the highly headed gases will pass alovely through the highly headed gases will pass alovely through the business and the surface of the formats of the surface are precised with recking bear thick may be sperated individually but they are preint and proportion of the furnace are precised with recking bear thick may be sperated individually but they are preint proportion of the present precise and considerable to a single shaft as shown in the li lustration by which they may be presided with a section which may be reciprocated lengthwise whose shaking down the side may be preciprocated lengthwise whose shaking down the side with the track to the total to the transace such as the production of smoke the preciprocated to the furnace consists of the safe pit which are provided with dampers to expected with the table of the safe that the since terms the side duties along of the safe pit which are provided with dampers to expected. stack Great care is taken to proportion the stack to

to regulate the in take of air
Is the spring of 1907 one of these batters was in In the suring of 1907 one of these betters was in-stalled in a factory at Down N J to thick the place of two bollers of 50 and 64 horse-power respectively. The sew boller on the usual rating of green area to the tabe and five area should have generated about 17 horse-power to tunder test it was found to develop 85 horse-power. Former's a stack 195 that high was required but with a new boller the sight wish ri-duced to one extending but 35 four above the boller stands to one extending but 35 four above the boller due to the state of the development of 154 place was give was 9 inches wife and 164 business long with the five was 95 inches wife and 165 business long with the low was 95 inches wife and 165 business long with the low was 95 inches wife and 165 business long with the low was 95 inches wife and 165 business long with the low was 95 inches wife and 165 business long with the low was 95 inches wife and 165 business long with the low was 95 inches just house possibility ever place

Maria Pale D male P H B M A PM E Pharma

The most significant trophy of modern times. Warmed by the midnight sun and drenched in the fogs and snows of the Arctic, it has waved at the apex of the earth, where a day and a night are a year, and every direction is south No battle flag was ever planted in the enemy's stronghold after struggles as severe as those which carned this banner to the goal It is the Star Spangled symbol of courage and endur-ance and faith beyond comparison It is the emblem of man's conquest over every obstacle, the triumph of spirit over matter

We have taken this priceless trophy, symbolical of all that is strongest and most enduring in American character, and have reproduced it in fac-simile in colors on the cover of the February number of Hampton's Magazine Every man, woman and child in America should preserve this reproduction among their most treasured possessions. The magazine can be bought, but the flag cannot-like all priceless things, it can

only be given away
Read Peary's Own Story. Now appearing
exclusively in Hampton's Magazine Every
instalment is complete in itself. In the February number Peary tells about selecting the I skimos for his last expedition, and describes

their life and their strange customs, what they have meant to him, and what he has meant to them No one can understand what it means to discover the North Pole, unless he knows about these strange people who helped Peary to find it

Whoever takes pride in being well-read and well-posted in regard to the world's progress, should read this story of the greatest discovery since that of Columbus No other magazine feature has ever aroused such widespread interest among thinking people

## **AMPTON'S**

#### "The Best Magazine in America"

The cost of the editorial and art work and alhed executive work in each month a issue of HAMPTONS amounts to about \$25,000 cash entirely in addition to the cost of printing paper distribution etc. (One feature Peary's Own Story to appear in only eight numbers cost over \$50,000 alone). This means that you get \$25,000 worth of high-class 100% readable magazine material for 15 cents or about 1,800 pages of the better eacher mosters it brokes number for \$1.50. best reading matter in twelve numbers for \$1 50

NEW YORK, SATURDAY JANUARY 29th, 1910

The Kilton is always gried to receive for examination illustrated articles on subjects of timery interest. If the photographs are slope, the articles short and the facts subject in the contributions will receive pictal attention. Accepted articles will be paid for at regular space rates

#### WAVE VERSUS SHIP

AS it a last despatring protest of Old Occur, when he lifted his giant hand in the blackness of the night of January 10, and smote the Lusitania' a blow which racked and splintered her lofty bridge and pilot house, 76 feet above the sea and crushed down her forecastle deck and decks beneath, giving them a permanent depression of several inches? For time was, and not very long ago, when the ma was the undisputed ster of the ship, and whenever Neptune saw fit to measure or the amin, and whenever represents saw into open the vials of his wrath and send his league-long rollers arross the deep the proudest ship of the day must needs stop at his bidding if she did not lades of turn and our before the tury of the blast Of late years, man, by virtue of his knowledge and mechanical skill, has been building in ever increasing lengths and breadths, and with such ceaseless en largements of bunker and boller room—he has so multiplied horse-power, and has called to his aid so ingenious contrivances for speed and strength and safety, that old Neptune must for many a decade past have for seen the humiliating day when he could no longer hold the destinies of the bold sea voyager in his hand, and no longer say to him. Thus far, and thus slowly shalt thou go! Following the hint of ultimate victory which was

piled by the "Lusitania" and 'Can that wonderful ship of the Hamburg American Line the "Doutschland," and the even larger and more powerful 'Kaiser Wilhelm" and "Cecilie' of the power-in Amer winders and with the advent of each glant vessel, man a growing mastery of the ocean was shown in ever increasing speed, and a closer approxi-mation in times of departure and arrival to the regu larity of transportation on land

was reserved for the steam turbine to supply the last mechanical device which was to give to man in his age-long struggle with the elements a weapon of complete victory, for in the combination of size and sirrogth and power afforded by the latest turbine liners there has been developed a ship which has illners there has been developed a sulp warm man demonstrated its ability to drive at full speed and all day long into the heaviest seas that the stormy North Atlantic equid pile across her path The writer will not soon forget a notable day some two winters ago, when the 'Lusitania, in weather which varied from a gale to a full hurricane, averaged for the twenty four hours a speed of between twenty-six and twenty-seven land nills an hour During the tumust of that tremendous struggle tenton anchors were shifted, it is true and steel derrick booms were swung athwariship and twisted as if they were no stouter than a boys tin whistle. Yet the ship steamed stated in the whole tabets of her hull

Ordinarily a transatiantic liner will drive her way against a westerly gale voyage after voyage, with no more serious hurt than the bending of a stanchion of the breaking of a pane of glass in the pilot house But onto in a long while there may come a com-bination of sens which are so related to the length of the ship that she may be riding down one wave, with her bow buried deep and her forecastle deck awash just as her stem drives into a roller, steep of front and of yast height. Then it is that the structure of the ship marks its moment of suprems trial and not even the officers 75 feet above water, are safe from the full impact of a solid Atlantic

On the Monday night in question, because of the tempestuous weather, the glass windows in the pilot temperations weather, the gloss windows in the pilot house had been lowered and the storm windows built of solid wood with a small heavy glass port light in the tenter, had been raused. The stern of the, ves-sel was lifting high on a recoding sea, and the form-

castle deck was awash, just at the moment that a wave of gigantic proportions loomed up at the bow. From the over the pilot house and the compass stand upon its roof, which latter is at least 80 feet above the normal waterline, this wave must have been som 35 feet high measured from the trough. The se 35 feet high measured from the trough he see was braking and therefore the mass of water must have had considerable forward momentum. The ship itself was running at half speed, and met the sea at a speed of from twelve to thirteen knots. When the mass struck the breastworks and pilot house, every one of the stout wooden storm windows was burst in, the woodwork being stripped clean to the zantes, and the stout steel framing between the windows was forced several inches into the pilot house. The sea ard, driving a piece of the woodwork bodil; through a hardwood casing containing a portion of the fire-fighting apparatus. The quartermaster was borne back against the bulkhead behind, carrying in his bands the wheel which was torn from its at The mass of water then swept into the office room and staterooms, filling them breast high with and this, be it remembered, at an elevation of 75 feet above the normal sea level

v, since the ship is some 80 feet broad at this point, and the distance from the pilot house to the stem must be at least 150 feet, and since, in order to roll over the pilot house, the waves must have been some 35 feet in height, at least 4,000 tons of water must have swept over the forecastle deck-as anyone with a pencil and pad may easily figure out for him self. It cannot be possible that the wave fell with much vertical impact, or the decks would have crum pled up like an eggshell, but the momentum was sufficient to crush the forecastle deck and the three decks below a few inches down into the body of the ship, leaving them with a permanent set Dramatic evidence of the enormous stresses to which the ship was subjected is afforded by the stanchions and solid steel bulkheads below the deck, which in some places, burkled out of the vertical as they yielded b neath the load above Had the 'lustania' not been built of special strength to stand such buffeting as the results might easily have been very serious indeed. and we are inclined to agree with her captain in his belief that many smaller and less stoutly built ships, disappeared utterly at sea, may been sent to the bottom by the crushing in of their under so-called tidal waves"

#### IMPROPRIATE PRESONANTES IN PRINCIPLE WORK

THE University of Kunsau has inaugurated a system of Industrial Fellowships, based upon a broad,y similar practice that has already been followed to some extent in Some three years ago Prof Duncan of the Europe Department of Industrial Chemistry directed the alon of manufacturers to the necessity for greater technical efficiency, and sugmented that this might be oted if the manufacturing interests in the field of industrial chemistry co-operated with the universities by establishing fellowships for research in cer ties by establishing renowanps nor receases an ex-tain specified directions. At the present time elseen followships have been established of which eight are not no peration. A full discussion of the scheme will be found in the current issue of the Suprepart, but the general scope of the movement may be gathered to the control of the following fellowships. from a consideration of the following fellowships lished

A renowany for an investigation into the chemistry of laundering, with a view to saving laundered fabrics, \$500 a year with 10 per cent of the profits. An investigation into the Chemistry of Baking estab-lished by the National Master Bakers' Association,

with the object not only of improving the chemistry of bread but of providing for the association of a trained expert on whom they could thereafter rely, \$500 a year together with a sum to be settled by arbi-

An investigation into the relation between the optiproperties of glass and its chemical constitution, \$1,500 a year and 10 per cent of the profits.

The discovery of new utilities for osono, \$2,000 s d 10 per cent of the profits.

year and 10 per cent of the profits.

The general form of the agreement calls for an investigation to which the holder of the followship stress his whole time and attention, with the exception of three hours a week which he devotes to work of instruction in the Chemical Department of the University The Pillow, who is appointed by the chancellor and other officers of the university, much have a resolution other officers of the university, must have a reputation in research, must be a member of the university, must in research, must be a member of the university, must work under the direction and advise of the Professor of Industrial Chemistry, and must forward through him to the industrial company, the decroy of the fellowable, periodical rejorts of the progress of big work. All discoveries made by the fellow during the tenure of the followable become the property of the industrial npany, subject to the payment to the fellow of 10 cent of the net profits. In the event of any disagreement between the donors and the holder, the chapterior of the university, or his appointes, is mu-

tually accepted as arbiter

The advantages accruing from those fellowships, according to Prof Duncan, are that the university gains increased opportunities for premoting research, that it obtains three hours a week of gratuitous and skilled instruction, that the manufacturer obtains the ad-vantages of vantly increased laboratory facilities and full library facilities (for lack of which factory re-search has been most seriously hampered in the past) that the manufacturer has consultative advantages, since the fellow appointed is at liberty to question specialists in the different fields of chemistry, that the manufacturer is freed from supervision of the wor research, and that on the termination of the fellowship he obtains, if he so desires, the services of a man cated to this particular need. As resards the fellow, he co-operates in the advantages above ascribed to the manufacturer, he obtains an inside knowledge of facmanufacturer, he obtains an inside knowledge of the-tory processes, and he is freed from the petty inter-ferences and jealousles of shop employees and the "pot shop" judgments of factory officials. Moreover, if he makes good, he obtains a position for which his train-ing during the fellowship renders him peculiarly qual-

Finally, since at the end of the three years' term all work done under any fellowship must be published free to the public, the latter becomes one of the most neficiaries of the new system. The inserrtant l tion of this last clause was at first resisted by so of the manufacturers, but in the end the donor, when it was pointed out to him that a really progre manufacturer would find that three years would give him a sufficient start of competitors, with objections

#### THE MOON AND BADIO-ACTIVITY

THE ROOF AND RADDO-AUTIVITY.

HIS probable infunence of the moon's movement upon the radioactivity of the sir is brought out by M Paul Besson in a paper who fine presented to the Anademis des Sciences.

We fine the radioactivity of the rin and M besson constudes that this radioactivity of the rin and M besson constudes that this radioactivity of the made with the radioactivity of the rin and M besson constudes that this radioactivity of the radio ground, as Elster and Ueltel also suppose He made-experiments in the summer of 1908 and 1909 and showed that the variation in the activity of mineral showed that the variation in the atmospheric pressure, being highest when the pressure lowered. Other authors ob-served the same fact. When the barometer descends the emanation from the soil increases, and the con-trary. But he noticed other variations which were unaccounted for, and thought that they might come from the tidal movement of the earth's crust, which was shown in a striking way by M Charles Lallemand of the Bureau of Longitudes When the moon passes the meridian it causes a tidal wave in the earth a crust, and the emanation from the soil is maximum at this moment, and vice verse, at least as may be d The author's observations lead to the following conclusions As regards atmospheric pressure for a one-hour test w hich is constant w aione for a one-hour test which is constant with rela-tion to the moor's passage at the meridian and thus-sceluding the moor's influence, the radio-activity in-creases when the atmospheric pressure decreases, as-shove noted. As to the influence of the moon, we find that at a constant barometric pressure, the activity is maximum for the passage of the moon at the meridian and minimum for the passage at the other side nuthor hopes to make a more complete series of ob-servations in order to establish his hypothesis. If the law of variation of the emanation coming from the earth could be established, we would ascertain the principal cause of the variation of the air's radio-activ-Should it be found that the moon's movd changes in the radio-activity of the air, we CAU would have the proof that the moon has an influence e changes of weather, according to the popular belief, this being caused by multiplying or lessening the centers of condensation of water vapor, outside of air pressure effects and others.

Mr T H Svedberg has succeeded in obtaining by Mr T II brether has assessed in obtaining by inter-rolest radiations, collisads scietions of various metals in different liquids. The metal to be purious dealed in different liquids, The metal to be purious contained as the perfectly freed on any surface and contained as the stage covered with the activition in a fint bowl, it is exposed from above to the redictions of a quarte glass mercury lamp. After a few minutes the liquid, when observed in the ultra-microscope, shows the characteristic suspect of a colloidal solution. Different metals and solutions show a rather different behapfor. Thus silver, copper, the and lead were possed in the contained as the contained of the cont

The heat is one of the most valuable of valitational plants. The ord garden varieties furnish savey of plants plants are garden varieties furnish savey the plants regulation, the large forage bests form an excellent vagetables, the large forage bests form an excellent regulation of the principal sources of sugar and alreado! The use fullered this valuable root has not been increased by the production of an edible floor from sugar bests. The dependent of alled sugar bests (Zintkenschnitzel) is already practiced in Germany on a very extensive a deep for cattle in the summer of the sugar best which, according to a pastry and before the recent chundral congress in London to entirely free from the distinctive flavor of the best and is suitable for use in making stakes, puddings, and pastry. As it contains about 65 per cent of sugar it can often be substituted, with advantage, for significant of the substituted of the development of sugar states of the superior of the production and grinding not only real less than the extention of sugar, but preserve at the sugar of the best, part of which is rejected in the form of molasses, in the precess of sugar making.

### A NEW ERA OF THE AMERICAN LOCOMOTIVE

#### TWO REMARKABLE ENGINES

It is not stretching the point too far to say that the design of the locomotives herewith illustrated, one for passenger and the other for freight service, marks a new era in the development of the American steam locomotive This is particularly true of the passen

This has been done in both engines by utilising the great length of belier spaces afforded by the sericulated system of construction. As will be seen from our sectional view, the belier proper terminates above the high-pressure ordinates. The series of tubes, around while the high-pressure ordinates. The shall, however, it is a few the reliculates and for states the takes of the same through a large next of tubes, around while the series of tubes, around while the series of tubes.

Weight of engine and tender, 30 tons. Tractive force, 30,4 tons. Heasting surface, 4,76 square for. Steam pressure, 30 points. Superheading and reheating surface, 1,181 square for. ( Jindebers.) Ten high pressure, Minches by Minches Driving wheelers, 37 techns. The most nevertal nessenger lecemetive in existence.... i new type

ger locomotive, with which, by the introduction of the Stallet articulated piston, it has become possible to haul heavy fast passenger trains which with the present type of locomotive, it is necessary to run in two sections Moreover, so powerful is this engine that it can haul over the heavy grades of the mountain divi sions transcontinental trains which at present call for the assistance of an extra locomotive

familiar, but the tion of the truly recently built for the Santa Fe Railroad is based on its great weight of 850 tons and its tractive force of 54 tons, both of which figures greatly exceed those for any previous freight locomotive Both locomotives were built by

the Baldwin Lotive Works for the Atchison & Santa Fe Rail

The most important novelty, common to both en-gines, and the one which marks a distinctly new era in locomotive practice in this country, lies in the means which have been taken to transform the locomotive from one of the most wasteful into a reason

tended forward to the low-pressure cylinders, and venued torward to the low-pressure cylinders, and within it are placed two nests of fire tubes, through both of which the hot guees pass on their way to the smokestack. The first of these is divided by a dis-phragm into a super hester and a re-heater, the second forms the feed water heater

Now, in the ordinary locomotive the gases, still very hot, after emerging from the front end of the fire tube, pass out through the sme

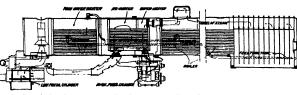

boiling point, as it travels from the tank on the tender to the b the boiler

The advantages of this system are that not only is

a much larger percentage of the heat energy of the fuel turned into useful work, but the super-heating and re-heating enable the well-known economies of compounding to be realised to the fullest extent. a consequence the coal consumption per ton mile has been reduced by soproximately fifty per cent, ten per cent of which

is estimated to be due to superheating and re-heating, fifteen per cent to feed water heating. rud twenty-five per cent to com-pounding These figures are at present merely an cetimate, but We see no real son why, with proper firing

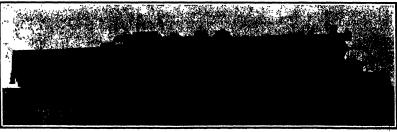

and intelligent handling of the throttle, these should not be realised in actual service The Santa Fe passenger locomotive embodies the first attempt to apply the articulated system to passenger service. The proportions are enormous, far exceeding any existing proportions are monotones, and account of the passenger locomotive either here or abroad As far as cylinder and driving wheel arrangements are concerned, the engine is practically a combination of the (Continued on page 113)

In this builde uset of the best in the Pr which is ordinarily lost through the smokestack, is utilised to superficut and reheat the steam on its way to the cylinders and to heat the feed water before it enters the boller

The new boller which saves 25 per cent of fuel

The Santa Fe locomotives return a large part of this heat to the boiler and engine Referring to the diagram, it will be noticed that those heat recovery devices first serve to raise the temperature of the steam as it passes from the steam dome to the high pressure cylinder Then the gases yield up still more

#### PUTTING OLD NEPTUNE TO WORK

Twice each day millions of tons of shipping in New York Harbor are lifted to a beight of over four feet and dropped the same distance by the tide This same work is done in every port to a greater or least degree. Many a man has enviously considered this inditure of power and racked his brains enormous expenditure of power and racred his oratines for a means of putting it to valuable service. How ever, the work done by the tides is enormous only be-cause of its vast extent and herein lies the delusion which many an inventor has failed to discover until which many an inventor has raticd to discover until the has devoted much thought and time on evolving a tide motor. The work done in raising of the "Lusi iania," for instance, which weighs 40,000 tons, repre-sents an expenditure of energy of only sixteen horseis utilized to operate a series of pistons pumping air into a compressed air tank. The compressed air tank and four pairs of cylinders are mounted on the main The piston rods are connected at their outer ends to the four floats and when these floats are rocks by the waves they serve to reciprocate the pistons and pump the air This action takes place regardless of the direction in which the waves are traveling because

the direction in when the waves are traveling because the auxiliary floats extend in four directions. An entirely different method of utilising the force of the waves is shown in Fig. 2. This consists of a large crib placed in the water and having one end open so that the waves will wash up over the floor of the crib as they do on an ocean beach At the back of the crib

rock to and fro the pinion is rotated first in one direction and then the other, and this motion serves to pump air into a tank. The air from the tank operates a manmatic motor which in turn drives a dynam a pneumatic motor which in turn drives a dyname and generates electricity. In order to permit the floats to swing about in any direction without damper of fouling the anchor lines one of the floats is mounted on a swivel which is securely anchored. By means of comtact wheels engaging contact rings on the servel the electricity generated is conveyed to a pair of cables which extend to the shore

The construction shown in Fig 4 depends for its operation on an entirely different principle—it is well known that the wave disturbance of the ocean does

Four novel methods of utilizing the power of the waves, PUTTING OLD MEPTURE TO WORK

r, this being due to the fact that the tide acts very slowly, taking six hours to raise the vessel to a

However, there is another form of energy displaye provery the sanction form of energy analyses by the ocean which is far more powerful than that of the tide, and here there appears to be more opportunity for capturing a portion of this power and devoting it to practical use. The waves of the ocean are not so deliberate as the tides and the chief difficulty with

so deliberate as the tides and the chief difficulty which the hivester must contend to that in time of storm they develop satisfy too much energy and are spit for wreck his satchies. In the accompanying segmenting we liturates some recept constructions which have been develop for the purpose of obtaining power from the waves. That shown in Fig. 1 consists of a darge square flowd only in the property of the purpose of obtaining power from the waves. That shown in Fig. 1 consists of a darge square flow of the purpose of the pur

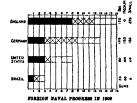

are a pair of curved deflecting walls before which is placed a triangular casing provided with a series of swinging doors or vanes. When the waves wash up the floor of the crib they close the vanes against the casing and divided by the prow of the casing are di-rected against the deflecting walls. The rear of the rected against the defecting with. The war of the infranction causing is opened, permitting the water to flow through as the ware recedes and strike against the rear faces of the vance opening them to the position shown in the illustration. The vance are garden to a series of patton reds which operate the cylinders to fill a compressed-sir chamber. The latter, by means of a pair of air motion operation a dynamo and earlier stress where the property of the pr

not extend to any great depth and it is the relative motion of the surface water with respect to the water at a considerable depth that is made use of in this case to generate power. A float is provided from the center of which projects a shaft fitted at its lower end with a set of radial fins. When the float is rocked by the waves the shaft tends to remain vertical owing to the waves the shart tends to remain vertical owing to these fins. Mounted on the float are a series of cylin ders provided with the usual platons which are con-nected to an extension of the vertical shaft just re-ferred to, and while the platons remain virtually fixed the cylinders are reciprocated upon them by the rock-ing of the float. The pistons serve to circulate oil through a rotary engine which in turn drives a dyna mo and thus generates electricity When the wave motion becomes too violent an electrically-operated by pass permits a portion of the oil to circulate without passing through the motor and thus an excessive speed

#### PORRIGH WAVAL PROGRESS IN 1909. BY PERCINAL A MINIAR

During the year just closed considerable naval activity has been manifested abroad. Not only have the principal haval powers adopted large programmes of new construction and made good progress with those already in existence, but the minor powers have st in a practical manner how widespread a hold th nought fever has taken on the mind of the world

Great Britain during 1909 has finished the last of the trie of battleship-ruisers of the invincible
type, of the details of which readers of the Scientiff AMPRICAN are already fully aware through the appear ance of the 'inflexible' at the Hudson Fulton celebra ance of the 'init. fibe' at the 'itings' me inconservers at those The three battleships of the 1995-7 programme - the Bellerophon, 'Temeratre' and "Buperb"-have all been passed into service. They are of 18,000 tons, 700 more than the "Drasdought," but differ in having sixteen 4 inch 31 pounders for their anti torpedo armament as compared with twenty-for 12 pounders The end of the year saw also the comple-tion of the battleship Vanguard, of the 1907-8 programme which was turned out by Vickers, Sons & Maxim in the record time for any ship since Dreadnought berself, of 19 months. The "St urreationages nerself, of 19 months The "St Vincent and Collingwood completing the 1997 St 170, will be commissioned this spring. All are of 19,250 tons, and have ten 12 in h 50-calibor guns (the main armament of the others is 4' calibors and twenty 4 inch rapid fire weapons. The thickness of the main belt is reduced to 9% inches in these ships compared with II inches in the earlier vessels, but a larger area of the hull is protected by thick armor vessels passed into service during the year include the unarmored cruiser "Boadlers," of 3 300 tons and 25 knots, designed to act as mother ship' to the deknots, designed to act as mother ship to the de-irroyer flotlillas, a number of 31 knot destroyers-"Afridi" (which had to bk accepted at 12 75 knots) "C'usadir," "Aunson" Baracon," "Maori, "Viking" and "Zulu A now type of submarine has been com-pleted This is the 13" of 600 tons, which showed and 'Zulu

d submerged She is fitted with twin-

screws, and has a steaming radius of 4,000 miles.

The vessels launched during the year are the bat-tleship "Neptune," of 20 250 tons, with the same arms ment as the earlier Dreadnoughts, but so arrange that there is a broadside of the whole ten heavy guns, and the armored cruiser "Indefatigable," 19,000 tons, carrying the same battery as the "Invincibles," but longer, enabling a wider are on either beam to be covered by the whole eight 12 inch guns. A number of small cruisers and destroyers have also been

launs led "Three new battleships have been commenced "They are the "Hercules, "Yolossum," and "Yolon," of the same displacement as the "Neptune," but with the five 12 luch gau, turrets arranged axially The armord cruiser Lion, "also laid down will be of 25,000 tons and 2% to 26 knots, and will carry ten 12 inch guns (Hermany has had a reverd year in salval construction Rhe has exampled her first two Dreadhoughts, the "Assaul" and "Wortfalen," of 18,000 tons in the "Assaul" and "Wortfalen," of 18,000 tons

armed with twelve 11 inch and twelve 59-inch gu Both ships exceeded 20.5 knots on trial, although de signed for 195. The armoved cruiser "Blucher" has been commissioned as flagship of the High Sea Floot s need commissioned as magnify of the right sea Front services equation. This reases cannot rank with the littlish 'invincibles, but she is nevertheless a powerful ship, displacing 15,500 tons and steaming 245 knots on trial. Her armament consists of tweive 8.2 inch and eight 59 inch guns, and her main belt is 8 inches thick. The battleship "Rheinland," sister to inches thick The battleship "Rheinland," sister to the "Nassau ' is now running her trials, and the "Po-

n will follow this spring Five large battleships have taken the water during the year Three of these are battleships—the "Out friesland" "Thuringen," and "Heisoland," each of 20,800 tons. They are the first German ships to be armed with 12 inch guns. Krupp's having built a 50caliber weapon firing a 981 pound abell. Twelve of cattory weapon fring a sat point and). I were or these guns will be carried as well as a similar num-ber of 6.7 inch in armam ut at least, therefore, these ships will be greatly superior to any British ship yet launched. The armored cruiser "Von der Tann" has also been launched. She is of 18,700 tons and will steam 25 knots, her armament comprising ten 114noh and a secondary battery, it is believed, of 59-inoh guns. The cruiser "G," following toward the close of

the year, is a sister ship

Two small cruisers, the "Kolberg" and "Mains," have
been completed. They are of 3,800 tons, earry fourleen completed. They are of 3,500 tons, earry non-teen 4 linch guns, and steamed 27 to 28 knots on trial The completion of destroyers continues a fac-tor of naval strength in which Germany leads the world Her truelve vessels of the 1808 programme are in commission at a time when those of the British programme for the same year are only being launched

programme for the same year are only using same and Three battleships have been laid down, similar to the "Helgoland," but equipped with turbines. They are the "Ersats Frithjof," "Ersats Hildebrand," and "Ersatz Heimdall" The armored cruiser "H," of the "Erests Heimdall" The armored crusser "H," of the 1909 programme, was laid down in December, 1908, in advance of the orthodox date. Two more small cruisers, twelve destroyers and some submarines have

n laid down auso seen hat down
All the French battleships of the "Danton" class
have now been launched They are of 18,400 tons and
will carry four 13-inch and twelve 94-inch guns. Admiral Boue de LaPeyrere, the new Minister o has done much for the benefit of the naval service. The next ships to be laid down, two of which will be started at once, will be of 23,400 tons and will carry twelve 12-inch and eighteen 55-inch guns

A start has been made in the re-creation of the Rus-A start has been made in the re-creation of the Rus-sian navy, and four battleships were laid down at the Baltic yards on June 16th last, where they will be built under the supervision of the British farm of John Brown & Co Their names are "Gangut," "Petropav-lovak," "Sevastopol" and "Poltava," and on a displacement of 23,000 tone they will carry twelve 12-inch placement of 23,000 tons they will carry twelve 13-inco and skitcen 47. The designed speed is 23 knots. The two Hlack See batthaships "Andrel Pervouvanni" and Imperator Pavel I" have been completed, as well as the small armored cruiser "Pallada," 7,000 tons. The

the small armored cruser "Pallada," 7,800 tons. The former are 17,856.0m seessle, carrying four 154nch twelve Sheh and twenty 47 fach gunz. The progress of Japan te difficult to follow, owing to the contradictory reports that emanate from that country However, too battlerships have been laid down—the "Kawashi" and "Settsu," of 30,800 tons, armed with twelve 151nch, ten Eloha and twaite 47 lock gunz. The "Satsuma," laid down in 1805, has been passed into service 'Displancing 13,830 tons, abe carries four 12 inch, twelve 10-inch and twelve 6 guns. Much difficulty is found in turning out ord nance fast enough to supply new ships, and the arm ored cruisers "Ibuki" and "Kurama," laid down in ored crimens July and "Aurama," hald down in 1906, are still delayed by this cause. Two new cruis crs, the 'Hukl' and "B" have been laid down. Or 18,850 tons they will carry six 12 inch and fouriest 6-inch guns, and steam 25 knots

Among the lesser powers Italy has laid down four large ships. The "Dante Alighiert' and 'Cavour' (laie "Leonardo da Vinci") will carry twelve 12 inch. "Michael Angelo" and "Galileo-Galilei, reported, eight 14 inch Austria has launched three battleships and proposes to build four 19,000-ton res-sels as soon as financial difficulties have been over come The first of the three Spanish ships, the "Espana," has been commenced, and will carry eight 12inch gune on such a low displacement as 14,780 tons.
The Brasilian "Minus Gerace," with twelve 12-inch has been completed, the "Sao Paolo" is nearly ready. for trials, and the "Rio de Janeiro" has recently be laid down The Argentine is going to have two battleships bulk, and Chile one A Chinese naval commission is touring Europe with the ultimate object of placing orders for three 15,000-ton ships; Turkey has sent Admiral Gamble back to England with in structions as to the ordering of two battleships, and Greece has allotted five million dollars for the purchase of an armored ship from an Italian firm.

#### HOW AN AMATRUR MAY FIND HALLEY'S COMET. BY BEY ROLL W ROLLING. Thinking it a laudable ambition to be the first ama-

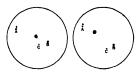

teur to find Halley's comet, I have been working with my 314-inch telescope for several weeks trying to locate it. I have not learned as yet that I am the first, arned as yet that I ar cate it. I have not learned as yet that I am the first, but being confident that I have succeeded in finding it. I have thought that other anastours might like to know how it might be done files the easy method here described may also be employed by sansteurs in other stumps existing of the beaverage. I have gone somewhat mto details. Despite the fact that once actronical journals have said that it would be some nomical journais nave mist tast it would be some time before the comet in question could be seen in a small telescope, I have the word of a prominent as-tronomer that it can now be seen in even a 5-inch-provided, of course, one knows where to direct his

So the first problem is to assertain the position of an comet. There are very few amateurs who have plescopes mounted with circles. Hence we must

adopt a pian that will enable us to find it without such aids. Of course it would be all easy task to locate it if one had all the equipment of an observatory, mersly by setting the telescope in the proper right ascension and declination.

w if we will turn to the recent files of the Scien Now if we will item to the recent these of the Retur-Man and the state of the state of the state of the ADDRAIN, we may find the right assemble and declination given for every either day during January and Pebruary. The data for the intermedister, can be easily deduced by taking half the difference of any two alternate days and adding it to the remove of any two alternate days and adding it to the remove of any two alternate days and adding it to the remove, and is the best for the average student. Both a star attas should be one of the first books owned has a masseur. Almost any good library can reveals you with such an atlast flow is not already at head. These with such an atlas if one is not arry one levrain you with such an atlas if one is not arready at hand. Then with the ophemor's before you follow the ocurse of the comest row day to day by tracing the right ascension and declination on the map. Note the day when the readings first comes near to nome prominent star. This will be the time to put the method to tripl. In order to know exactly how near the comet will be to the star, consult the Nautical Almanac or any other source accessible to find the R. A. and Dec. of the star Upton or other star atlases will give the data for

ome of the stars.
By this process I found that on the eve vember 30th the comet was to be near Aldeburan in Taurus, so I began in good season to make my trial The evening before I made four carefully constructed charts of the stars visible in my field of view used my 45-power eyepiecs, and this meant about 40 minutes or 43 minutes of are, in the field. Upton or page 14 gives the R A of Aldebaran as 4 hr 30 min. Upton on page 14 gives the H A of Aldebaran as 4 hr 30 min., and the Dec as +16 degrees 19 min. The R. A of the comet on this day was 4 hrs 30 min., and the Dec. +15 degrees 55 min. The R A is the same, and the Dec places it 33 min. south of Aldebaran This would Dec places it 22 min, south of Aldecaran This would bring it within the field of view of the telescope. One can estimate quite accurately the number of minutes of arc within the field of view of the telescope by sighting it upon some object whose size is known. The moon is suitable for the smaller powers. It is

rd 11 P. H. cont time. Jan. 14th, 1910 time Jan. 14th, 1910.

A is a small double star, B is a star of the 5th magnitude; C is a very dim star the telepotion of date as Haller's count.

min of arc in diameter Epsilon Lyraes may be used for the higher powers. The two principal stars of this double (in reality a quadruple star) are 3 min apart.

My 200-power presents a field of vision of about 6 or 7 min. Now if the polar axis of the telescope is pointed exactly to Polaris, it would be necessary only to make one map of the desired area and esti-mate the 12 min distance to the south I had my telescope, on this particular evening, directed from a d-story window and was not sure of my exact polar location, so I drew the four maps, hoping to be more certain of including the comet within the list more certain or incinuing the comet within the list. in making such observations and trying for a definite location north or south, east or west, one must bear in mind the fact that an astronomical telescope inverts the object. A little study with the moon, which can also be observed with the naked eye, will help straighten out this matter. Now after making the straightan out (his matter Now after making these form may not he weeting of the 29th, I planned to observe carduly the next eventing to see if I had any object. In view out viewed the night before But the Object. In view out viewed the night before But the coning rising of the moon, while the second risk coming rising of the moon, while the second risk coming rising of the moon, while the second risk in view While I had thus planned to locate the country with the process of addition (and this whule have been to more destrable as it would have anothed a more carried service) a cleded to beef for it the next evening by a process of addition (and this would have anothed as more carried service). I carriedly a leaded to beef for it the next evening by a process of elimination is on the evening of the But I carriedly made four new maps of the sense areas like those shown in the engraving and made areas like those shown in the engraving and made areas in the through the control of the process of the control of the process of the p four maps on the evening of the 29th, I plan

THE LASE WASHINGTON GAPAL.

A public work of much importance, though not wishely known, is the proposed canal connecting the tidal waters of Fuget Sound with the fresh water lakes, Union and Washington, lying in or adjacent to lakes, Onloin and wassington, 1791 m or acquest, the city of Sentite, Wash. The project is a very old one, though it has yet progressed to further than the angulrement of right-clevary, the formal adoption of a project by the War Department and its submission to Congress, and certain local measures now in progress for the raking of funds to said the government in the

se canal is to be a joint enterprise, to t of which the government and the local community will of which the government and the local community will withmately contribute about equal shares. The local community has airsedy acquired and delivered to the United State the right-of-way, costing about 1500.00 It will excavate the channel at a cost of about \$1,000.00 The railrends, street care commaniss and city will have to construct bridges and other crossings at their own segmens, so that the entire local outlay will prob-shly foot up about \$1,500,000. The government will have the contribute of the contribute of the contribute of the half of the contribute of the contribute of the contribute of the half of the contribute over a contribute works and a newerbuild the lock and controlling works and a power penia to some and controlling works and a lower plant. It will also build the entrance works and take care of certain other features of the project and will maintain and operate free of toll the completed work. The cost to the government will be about \$2,500,000

he cost to the government will be about \$2,500,000 Following are some of the benefits of this work which justify its construction and which also justif a division of the burden between the government and the local community

It will be of great value to the navy by giving an admirable fresh water waiting basin for vessels laid up in ordinary time of peace Puget Sound will al-ways be an important naval rendervous, and the Navy Yard is only 18 miles from the canal entrance.

It will give a much needed expansion to the harbor It will give a much needed expansion to the hartor facilities of Elliot Bay The practically available frontage on the Bay does not exceed 5 miles, and a large part of this is in the hands of the railroads. large part of this is in the hands of the railroad.
The opening of the lakes will give fully ten times
greater frontage than at present, and much of it better
situated for public convenience. It will make accessible extensive sites suitable for manufacturing cetablishments The areas at present available, where both rail and shipping facilities can be had, are extremely

The completion of the canal will give much a The completion of the canal will give much newests are anchorage grounds for shipping Many vessels are laid up during the winter, and owing to the excessive depth of water in Puget Sound, suitable anchorages are very scarce Not only will the lakes afford better are very scarce from the destructive effects of marine life which is very active in the waters of the sound. The hulls of vessels will suffer much less deterioration than in asit water Likewise subaquoous timber construction, which cannot be depended upon for more than a year in the sound un-less the timber is "treated," is practically imperish-able in fresh water. The shallower depths also will ch less expensive for wharf construction and

The lakes are, of course, entirely free from tidal fluctuation, which on the sound has a mean range of 10 feet and an extreme range of 18 feet. The fixed level will be a great gain in all shipping operations.

The foregoing advantages are of a general character, but there are others of a purely local character

ter, but there are others of a purely local character that are very important.

The cost of drayage in Sentile is large because of the extremely newest topegraphy of the city and the water front. The canal will fank the hills, distributing the right throughbout the city and reduce the cost of drayage, it is estimated, by 25 to 50 cents a ten. This suring will in a few years equal the local contribution to the cost of the casal.

The lowering of Lake Wandhagen to the level of The lowering of Lake Wandhagen to the level of

Lake Union will drain all swamp areas around the shores of the lake, relieve the valley of Black and Duwamish rivers of the floods of Cedar River by turning the latter stream directly into the lake, and will make the whole run-off from the Lake Washington make the wools run-off from the Lake Washington and Cedar River watersked (569 square miles) avail-able for power at the lock site. Drainage, flood protec-tion, and accossibility to shipping will greatly enhance land values around the lakes. Lake Union will be-come virtually a great dock in the very heart of the

city. The removal of the natural burrier between the two lakes and the establishment of a connection with the sound will greatly enlarge the field of pleasure bas-ings which already plays a large part in the life of the boal community. Some has is feet that they opened changes will detend from the natural beauty of Lake Wankington, but a careful analysis of the question shows that the affect will be improved; the gives a period of two or three planes, and will re-gister a period of two or three planes, and will re-infer a period of two or three planes, and will re-infer a period of two or three planes, and will re-fer the provinces of the second of the control of the planes.

chamber. The large lock or chamber will be about 800 feet long by 80 feet wide and 35 feet deep and will take any vessel likely to visit Paget Bound for many years to come The little lock will be 100 feet long by 30 feet wide and 16 feet deep and will be used by small craft of all descriptions, the number of which is very large and rapidly increasing. Probably 90 per craft of transfers of vessels will be through this lock

The entire structure will rest on an excellent foundation of very hard, tenacious blue clay of great depth It will be built of reinforced concrete and steel and will embody the best features of modern lock conwill embody too best leatures or mosern love, and struction The controlling works at the lock will con-sist of a power house by which the entire flow through the canal will be turned to use. The great reservoir formed by the lake gives complete control of the run-off and distributes the flow quite evenly throughout the year. The revenue from this power will return the year The revenue from this power will resura about 14 per cent on the cost of the plant and will nearly pay for the future operation and maintenance of the canal. The problem of maintenance will be greatly simplified by the entire absence of sediment stream sumplimes by the entire absence of sediment in the water and consequently of deposits in the canal and the necessity for dredging. The physical problems involved in the building of the canal are of the sim plest character

This canal has been the droam of Seattle er it began its existence, but the rapid growth of the city and the great variety of interests affected create oppo-sition here and there which has succeeded in delay-

This great sait water lake will form an excell r for laying up naval vessels an increase harbor frontage of Scuttle THE LAKE WASHINGTON CANAL

ing the work much longer than should have been the case It is now expected that the project will be com-pleted within the next three or four years

## The Boy's Kndorsemen

Standing fifth among books most in demand during Standing fifth among books most in demand during the week ending January 18, 1910, as reported by the Circulation Department of the New York Public Li Parties, in "Pas Besintle American Boy," by A. Rus-bries, and the Company of the Company of the Company selves counts for more than the many favorable re-selves counts for more than the many favorable re-relyes that this book has reverbed Boys are not in-fluenced by the criticisms that appear in magazine, for to a great extent by selveriments. The fact that they frequently call for a book at the library is once that they thoroughly appreciate that par ar work "The Scientific American Boy" takes ticular work ticular work "The Scientific American Boy" takes up the story of a group of boys with built tree huts, log cabins, caves, bridges water wheels, tents, tramping outfits, etc. A sequel to this book has just been published, entitled "The Scientific American Boy at School," which continues the story and tells how to make a variety of things, including dams, boats, gliding machines, sun disk, cances, and many new devices for outdoor recreat!

Some Curtis turbine driven units of 14,000 kilo-waits capacity are in course of construction at Schenectady What 14,000 kilowatts means is shown in the Current Supplement by Illustrating the amo question shows that the affects will be impressed that the amount of the period of two or three years, and will result in framework that the amount of the period of two or three years, and will result in framework that the amount of the period of two or three years, and will result in framework to the period of two or three years, and will result in framework that the period of two the period of the perio

Albert Moyer, the well-known authority on concrete, presents a paper on the possibilities of the uses of mineral oils mixed with concrete. The treatment of disease by injecting into the blood the serum, or watery part, of the blood of an animal that has been made immune to that disease is popularly discussed by Dr Fritz Meyer Dr V Grafe contributes an excel lent article on the miniature art of Nature and Science Suggestions are made for observing Halley s comet. Dr H A Gins writes on the optical method of studying immunity to bacterial disease. Many of cur readers have no doubt wondered how an ex can really prove that he reached the Pole, it orer view of the recent Copenhagen declain. The method of examining an explorer's notes and ascortaining whether or not be reached the Pole is excellently presented by Professor J Hammon Smith

### Carrennandence.

#### WHY BAND SAWS BREAK

To the Editor of the Scientific American Mr R Miner of Lumberton, Miss, has insert mr it miner of cumpercon, mass, has mested an article in your valuable paper, the Stavrnic Auraica to of November 19th, 1909 conterning the causes of breaking of springs. He also relates the breaking of bendsaxs, which is a very important point to overcome, as it is a well-known fact to all who use bandsaws that a saw after running a few hours becomes longer in the back edge on account of the back pres-sure from the saw guide which gradually brings the m more and more toward the teeth or sawing odge

If any little cracks exist by reason of improper fin tabing they will certainly increase and the flaw will break. If the manufacturers of bandsaws would study this matter they would soon find out that the fault lies in the carriess way of making the steel and preparing it for a saw

Manufacturers who have won reputations for mak

ing bandsaws in smaller sizes as from % inch to % inch, are looking for too great a profit and forget to make use of the same skill exerted in making handsaws for exhibition

Hy an average approximate estimate a % inch band-Hy an average approximate estimate a % inch nan-saw will not run long chough to wear for one-half dozen filings before it is broken in so many places that it is impossible to make any more use of it. Chicago

# A CURIOUS PHENOMENON.

To the Editor of the Scientific American While driving along the shore of Canandaigus Lake, in the State of New York, on Tuesday, January 4th, I observed a curious natural phenomenon

The temperature of the air was six degrees above zero, a light northwest wind blowing and the bright sun of the afternoon occasionally obscured by the pres-ence of large and low hanging cumulus clouds.

The surface of the lake was covered by vapor caused by the difference in temperature between the cold atr and the comparatively warm water. This vapor visi-ble in the form of a slowly rising, done, white must gathered in spots in masses rising higher than the surrounding mist. As these masses of vapor reached a height of some twenty feet they appeared to take on awagnt or some twenty rest they appeared to take a rotary motion and formed themselves into columns slowly rising until their apease met the lowlying clouds, where they spread out in a funnel shape exactly as do water spouts. The columns warded from a early as do water spouts. The columns warded from a sconding in a straight line and others bent into fan ascending in a straight line and others bent into fan tastic curves by the action of the wind I saw a great number of these mist whiris during a drive of some two hours, covering a distance of ten miles along the lake shore, and as they formed and drifted slowly across the water illuminated by the rays of the set ting sun, they were a beautiful and to me a unique spectacle

Can you tell me if similar phenomena are often observed? JAMES S. LAR.

Speaking before the Royal Society in London on the subject of magnetic storms Mr E W Maunder super intendent of the Solar Department of the Royal Ob-servatory, Greenwich said that magnetic disturbances were in some way connected with the rotation of the sun upon its axis. It was clear that, besides sending sun upon its axis sun upon its axis. It was clear that, besides sending us light and beat the aun sent some kind of influence which came only from certain portions of the surface and came along closely restricted lines. They found there was a tendency for magnetic disturbances to take place when a sun spot had got to a definite portion on the sun's disk. If they took, it has the instructed had came from the sun and struck the earthtion on the sun's disk If they took it that the indu-ence that came from the sun and struck the earth came from the center of the sun spot, they would be able to calculate how long it had taken place, and, assuming that, they found it would take about twenty six hours to come from the sun, a distance of \$3,000. 000 miles, to the earth

# A GREAT OPEN-AIR TELESCOPE

BY PROF. S. A. MITCHELL COLUMBIA UNIVERSITY

A giant telescope has been erected in Germany having for its main purpose the making of astronomy popular through whilitions to the public of the heav The United States has repeatedly fol lowed Germany in her advances along scientific lin and here would be a splendid opportunity to emulate her by the creation of a great public telescope (say) in New York city

A contrast of this new German telescope at Trep-tow (mar Berlin) with the highest development of American manufacture proves of the greatest interest in the Yerkes telescope (see Scientific American De cember 25th 1909) we have a great instrument given cember 20th 1999) we have a great instrument given over to vast research, handled by a corps of expert astronomers leaders in their special lines of work Prof E E Barnard is there with his keen eye for the necasurement of the positions of comuts, star (insters, etc., for the depicting of slight planetary details, or with the help of the photographic plate for the hor trayal of Mars on a large scale. The greatest living authority on double stars Prof S W Burnham spends two nights cach work with the great 40 lach refractor The director, Prof E B Frost, takes care of the spec trescopic side of astronomy by photographing the tra of stars for the determining of their motions in the line of sight and by day time the telescope is made use of to learn of interesting phe-

nomena about the sun. This gre-telescope is a model of engineering This great perfection with its great tube and massive parts rising floor and ro-tating dome it is mounted in what is known as the equatorial

But how different is the Trentow telescope' Erected with other pur-poses in view, it is not necessary to poses in the it is not necessary to have expert scientists to keep the telescope employed almost every hour during the day and night constructed under a different plan constructed under a different plan its unnecessary to have a great elevating floor inside of a huge rotating dome, for in fact the dome is dome away with and the tele scope is used in the open air? This then brings something radically new in the old seture of astron omy, something entirely different in the construction of a great tele-scope. And this new form of in strument has many points in its favor that make it a most interest ing telescope.

The director of the Treutow Ob vatory, Dr F S Archenhold, by

his radical ideas came into opposition with the Ger scientists who ridiculed the idea of placing in the open air with no protection from the wind a great tube 68 5/10 feet in length seven feet longer than the Yerkes telescope (62 feet) But undaunted, Dr Arch enhold persevered and finally succeeded in collecting sufficient funds for the erection of the intgest tele-scope in the world. And this, too in scientific Ger

Any'
The front page illustration shows the Troptow telecope. The old equatorial form of mounting was dearted from, for this requires that the eye and of the scope. The old equatorial form of mounting was de-parted from, for this requires that the eye-end of the telescope be raised through a vertical distance ap-proximativ just fit he length of the telescope tube in vicaling a star overhead and one near the horizon. This necessition of very expensive clearting foor run by electric motors (No events Assaura, December 10.1, 1986 by senting the telescope tube in a great child was falle to have the eye-piece may be accepted exhed was falle to have the eye-piece may be a sent to exper-dendly was falle to have the eye-piece may be a sent to experceasing was sain or in the telescope tube upward into the air. The details of this will be readily seen by referring to the lituariation. This climinated the ris-ing floor and saved many thousands of dollars. The low forked mounting with its heavy movable parts placed on a solid concrete foundation insured a stable instrument and as the whole construction had no

great height it became possible to house the telesco b) turning the long telescope tube into a horizontal position and pulling over it a cheap portable house By using the telescope in the open air it became possible to entirely eliminate the great dome, and thereby save again more thousands of dollars. The result of these plans were that Dr Archenhold was able to build the completed instrument for the modest sum of \$62,50 Of this sum \$11,500 was spent for the kin, which was made of the celebrated Jens glass ground by the cid-established firm of Steinhiel, in Munich The lens is 27 inches in diameter, and is an excellent one

The radical separatre from old-established forms in tilminating the dome has many points in its favor builded the mere saving of money, and size many drawbacks As is well known to astronomers, the temperature of the night air is continually failing (especially in the early part of the night), and it is impossible to have the air in the interior of the dome imposition to have the six in tas interior or for dome at the same temperature as the outside six. This causes the heated air to pour out through the all of the dome, and also produces currents of air in the interior of the telescope tube itself. All of this makes "bad seeing," and a distortion of the telescopic imagethe bane of the existence of the professional astronome

it is necessary to drive the telescope to make it more from east to west, otherwise owing to the earth's rota-tion the object would quickly more from the field of the telescope in the Traytow (elescope both observer and instrument must be moved, and the details of how this is done by a % horse-power motor regulated by the leader of the control of the control of the control of the seen in the smaller illustration.

The Cost of Our Navy.

IT CONTS A GOOD DEAL OF MONEY TO RUN A NAPY The actual expense of running the navy of the Unit States for the past fiscal year a cunted to \$43,790,000 in this sum is included everything, from the pay of enlisted men to the repairs and equippage of vessels.

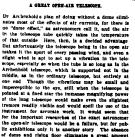

And the vessels include the tugs and receiving ships as well as the battleships.

The battleship "Connecticut," flagship of the Atlan c fleet, may be taken as an example of the cost of keeping a vessel of that type in service The pay of officers and enlisted men attached to this vessel with the other expenses amounted to more than \$790,000 during the fiscal year just passed. The Atlantic fleet in that period included sixteen first-class war vessels vis., six of the "Connecticut" type, five of the "Georgia" class, and the others ranging from 13,000 tons to 11,500 tons. The average cost of keeping a vessel of the "Georgia" class in commission, not

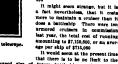

including repairs, is \$677,500 a year The classes below the "Geo quire expenditures ranging from \$532,000 to \$604,000 While the fig. ures will vary for the same vessels in different years, the cost changes vary little from year to year for the same class \$10.521,000 was the total cost for running the sixteen ships of the Atlantic fleet for the past year There were twenty three first-class battleships in com mission last year, and the total cost of keeping them in service exclusive of repairs, was \$13,035,000, making an average cost for running them \$592,084 On all these ships the repairs amounted to only \$100,

It might soem strange, but it is a fact nevertheless, that it costs more to maintain a cruiser than it does a battleship There were tea armored cruisers in commission

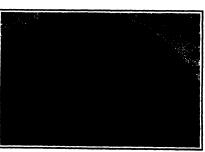

It would soon at the present time that there is to be no limit to the intermediate of the time to the intermediate of the time to the intermediate of remains appeared for remains appeared for intermediate. For instance, we have a subject to the intermediate of remains appeared for commission, the "Michigan discharged for the Corollar," and Corollar, and the control of the Corollar, and the control of the Corollar, and the

of that cultiles steep, then, is a decided assumings. Dut unfortunately the telescope being in the open air makes it the sport of overy passing wind, and even a slight wind is apt to set up a vibration in the telescope, expectally so when the tube is so long as in the Archenhold telescope, which is supported not in the middle, as in the ordinary telescope, but entirely at one end Though the vibrations may be small and one end Though the vibrations may be small and imperceptible to the eye, still when the telescope is pointed at a fixed star the immense magnifying power of the long tolescope would make even the slightest tremors readily visible and would spoil the use of the fromors readily visible and would spott the use or tan distriment. For accurate work, It would seem that for the important researches of the exact astronomer the operafir elsectope would be a failure, but for pub-lic exhibitions only it is another story. The absence of dome and rising foor elisionstee a great amount of the expense, and the modest amount of the popular of the expense, and the modest amount of the popular subscriptions can be all put it also the construction of of the expense, and the modest amount of the popular subscriptions can be all put into the construction or a telescope thus obtaining a much larger instrument. The telescope is raised and a star located by means of a 54,-horse-power electric motor: it order to keep of a \$14-horse-power electric motor. In or the telescope pointed correctly at the cele

The Philadelphia Rapid Transit Company reports that on certain of its lines in that city stone the intendention of paya-prometer; stront care, the support of accidents to persons has decreased it per cent. This remarkable change is authorized to the aprangement of closed foort and stops, making it impossible for parangers of one or of the ones now accident.

Yiew taken under the mounting, showing the electric motors for driving the telescope.

# **AMERICA'S FIRST AVIATION MEET AT LOS ANGELES**

## DETAILED ACCOUNT OF THE FLIGHTS MADE BY THE AMERICAN AND FRENCH AVIATORS

The first aviation meeting to be beid in this country opened at Los Angeles, Cal, on the 10th instant. Louis Paulhans, the record-breaking French aviator, was present with two Farman biplanes and two Bierlot monoplanes. America was represented by Glenn Curtias, C. F. Willard, and C. K. Hamilton, all of whom flew curtiss bibliancs. The field that served as an aerocurtiss bibliancs. The field that served as an aerodrome was located a few miles from Los Angeles. It was not a lides liplace for flying since it was not level, One end of the field was at a considerably higher elevation than the other and the machines were, therefore, obliged to five quite high in order to pursue a level course A hexagonal course of 1 til miles was used Only a few short lightly sever made by Means

Curtims and Willard the first day Messra Beachy and Knabenshue, in their dirigible balloons, few 200 fort above the grand stand against a which of 10 to 12 miles an hour Paulhan made his initial flight of 8's minutes at this time, covering an estimated distance of 4% miles In the second flight he remained aloft 10 minutes. Ills third flight lasted 29 minutes is

The histories was a significant of the relative flow in the first production of the production and the production of the production of

sides dashing at the grand stand and just clearing the heads of the spectators, he flew out of sight over the neighboring ranches

On the second day the first flights were made by Paulhan, who took out his new Farman biplane and drove it thrice around the course in a stiff wind, said to be of 18 miles an hour velocity, which was blowing from the ses. Now to for variety he mounted one of the tiny Bleriot monoplanes, with which Miscarol had been attempting to get off the ground—lie had no difficulty in flying it in the wind that was blowing. Although it bobbed up and down and was tossed about like a small boat on an augry wa Paulhan flew about the field and several times swept past the grand stand, perfort various maneuvers and rising to an estimated beight The speciators gave a sigh of relief when he finally landed across the field from the stand was soon out aga'n with his Farman biplane, in which be quickly disappeared from view far to the north Shortly after he reappeated over the trees of a nearby ranch, and frequently charged at the grand stand, turning aside just in time to clear the speciators or cise to sweep over their heads. This flight of about NE miles lasted 21 minutes and 12 seconds. It was the fourth flight he had made on the second day of the mostling. After Paulhan's flights, Mr. Curtiss brought out his Rheims racer, which is fitted with an S-cylinder unter-cooled motor of 50 horse-power Mr Fancuilli ed on board with Mr Curtiss, and the machine shot into the air for its speed test with a passenger After describing a wide circle in front of the grand atted (urise few around the course at a speed fig ured out by Lieut Paul Beck, of the Army Signal Corps—one of the judges—at over forty miles an hour Paulban immediately started a flight. At the same time Messrs Willard and Hamilton started on their Curtiss biplanes in front of the grand stand Curtiss followed them a few moments after with Mr

Clifford Harmon as a passenger All four machines were flying at the same time a spectacle well worth seeing Paulasn landed a worth seeing Paulian landed a few minutes later, took on one of his mechanics as a passenger and twice circled the course as readily as he had done alone

Curties established a new start ing record and also a record for landing but Willard beat Curtises in the latter respect. Curtiss start ed from a marked square of 400 square feeet flew once around the aquare feeet flew once around the field in something over two min utes and landed exactly on fine aquare from which he started. He by getting off the ground in 62/7 is after a run of but 98 f Paulhan required 13% seconds time and a run of over 100 feet

The great event of the third day was Paulhan's successful attempt at breaking the world's record for altitude The existing record had

een made only six days before by Hubert Latham at Deen made only six days neutro by require taxinan as Mourmelon, France, with his Antoinett monoplane, and was 3,444 feet. Paulhan started in front of the grand stand, and heading north, he went steadily upward in circles until he was nearly a mile high Bo high did he fly that to the eyes of the oulookers the machine appeared the merest speck in the sky After ascending some 46 minutes, he pointed his bi plane once more toward the carth, and came down at a much greater angle and in about one-sixth the time minutes) The registering barometer on his ma registered 1525 meters or just over 5,000 feet, (7% minutes) so that Paulhan had apparently beaten Latham's rec ord by some 1500 feet. He was given a great ovation upon landing. The total length of the flight was 53 minutes 461/5 seconds. Paulhana helght, as mea-ured from the ground, was officially determined at 4.165 feet.

The fourth day Paulhan gave a good demonstration The fourth cay rauman gave a good nemonstration of the weight-carrying ability of this new Farman ma-chine which is much smaller and weight 226 pounds less than the regular Farman biplanes, by taking up his two assistants Maisson and Miscarol, and circling neveral times around the course with them. Curtiss circled the course ten times in 24 minutes 54 2/5 seconds. Paulhan tried to beat this time and failed by onds. Paulban tried to best this time and failed by five seconds only Previously, he made three laps in 5 18 1/6 carrying his wife as a passenger After circling the field to alighted readily in the marked-off square from which he started In another fight of minutes' duration he carried Very Ferris as a passenger. He again reworted to his sensational methods, friging low over the grand stand, making sharp turns, etc. Hamilton, Paulban, Curries and Willard qualified in three-lap sights for all oversats. The first name ded in three-lap sights for all oversats. The first name made a flight with his vertical rudder locked, in order to show that this rudder does not have to be used in connection with the balancing planes, as is done by

the Wright brothers when they warp the planes of their machine to correct its transverse equilibrium. This combined operation of the equilibrium-maintaining device with the vertical rud strongest claims in the Wright patent. Where pla strongest claims in the Wright patest. were pames warping is employed, it is necessary, in order to pre-vent the slewing around of the machine, when the plane is warped to a greater angle. With balancing planes like those used by Curtiss, the resistance inserted at one end of the machine is as great as at the other, the consequence being that the vertical rudder does not necessarily have to be used. This flight with the rudder fastened demonstrated very well the difference between the two systems. Mr Willard again flew once around the course and landed in a measured once around the course and landed in a measured square, thereby winning a prize of \$250 Paulhan was presented with a \$500 silver cup by onthusiastic citi presented with a 8000 suver cup by ontinumstate cut: sens of San Diego. The next day he made a cross-country flight of some 16 miles to San Pedro and back, circling above the revenue cutters in the harbor and being greeted with cheers by the inhabitants. Paulhad also made 6 circuits of the course with his assist ant in 1814 minutes, and afterward flew twice around ant in 18th minutes, and atterware new twice around it alone in the Bierlot monoplane. His fastest hap in the latter machine was done in 2 43, which equals a speed of 341 miles an hore. Curtiss made the fast cat lap of the course in 2 12—a speed of 43 45 miles per hour. Subsequent to a race with Beachy, Knabonshue made a lap in his dirigible in 5-10 2/5—a rate of 18 4 miles per hour Hamilton tried for the slow lap prize and succeeded in making one circuit of the course in 3 362/5- a speed of 26 78 miles an hour The time of Willard's slowest lap was 3 11 1/5 Hamilton made ute flight for altitude, reaching a height of

But very little flying was done on the sixth day of the meeting, owing to wind and rain. The field was wet and inuddy, but notwithstanding this, all the ayi-

A NOVEL AMERICAN ARROPLANE AT THE LOS ANGELES MENT

ators got off the ground without much difficulty and made a few short flights. Paulhan attempted to Curtiss' ten lap record, but he was unsuccessful lard and Hamilton also made an attempt at this y ord, the latter covering the 161 miles in 30 34 3/5 or at an average speed of 317 miles an hour Mis-carol, Paulhan's assistant, made a brief exhibition flight with a Bieriot monoplane In landing, the manight with a signific monoplane in landing, the ma-chine thipsed to one side, causing the wing to strike the ground and break off. The accident was blamed upon the substitution for wing warping of the movable ends of the tall, which normally move together and act as the forizontal rudder By moving these ends of the tail in opposite directions, the transverse equilibrium can be maintained fairly well under ordinary conditions, although this method is not so positive as that of warping the wings themselves.

nday January 16th, but few flights were : the weather still remained inclement. The following the weather still remained incisement. The following day, however, Paulian attempted to byeak Farman's record of 4 hours and 17 minutes. After remaining a slot 1 hour, 56 minutes, 97,875 seconds, during which time he covered 166 miles, Paulians was oblighed to desend on account of a leak it the gasoline tank. He therefore did not come within 1% hours of equaling Farman's record. Hamilton also Sew during some of the time that Paulian was making his cardermane flight. He kept at a lower level and made 11 circuits of the course, but was obliged to stop on account of motor trouble Curties lowered his time for ten laps to 28 minutes, 43 2/5 seconds (49.71 miles an b His fastest lap was three seconds slower than his best previous circuit. Paulian covered ten laps in 25 51/6.

Beachy made one lap in his dirigible in 4:57 4/6 (1946 miles an hour). This was the fastest lap second by any dirigible during the meet. "The Gill-Dosch biplans, which is very much like the Cur-lisa, and which was constructed by two scattleness

from Baltimore, Met., made several intempts to sak off the ground, both was only successful in sanking a few short jumps. Mr. Clifford Harmon made a short dispit alone in his new Currier meables. These the successful and Truesday, January 13th, is hoteworthy for the long cross-country flight of Monz. Fusilizat, who flew to "Justicy Baltiwith vanction and beat, a distance of short

"Landy "Baldwis" ranch and back, a distance of showt I'dly miles, in bour; a minutes, 4847 seconds. In the course of this flight he rose to a height of 2,139 few. according to the regularing baronster carried in the biplane. Most of the time he was at a height of between 1,000 and 2,000 feet. During the returns [our-ner, which was made in about 23 minutes, Pauliana And to fight against a rather strong westerly which and yet he is said to have required only about three minutes more securities that he was the said to have required only about three minutes more securities that he was the said to have required only about three minutes more securities that he can be said to have required only about three minutes more securities that he can be said to have required only about three minutes more securities that he can be said to have required only about three minutes are securities that he can be said to have required only about three minutes are securities. utes more returning than he consumed in flying to the ranch Probably at the elevation at which he was traveling he did not encounter as strong a wind as was blowing near the earth.

January 19th was given up to the making of a mun January 19th was given up to the making or a num-bor of flights with passengers. The weather was per-fect save for a puffy wind in the early afternoon, which later died out altegether About 2:80 Pi M Paulhan started on a cross-country flight with his wife rauman starteger as a cross-conntry night with his wire as a passenger After civing once around the field he left the course and headed directly toward the ocean. He flew at a height of some 500 feet to Re-dondo Beach in the course of his flight he passed over several other neighboring measide resorts. He re-turned safely after 23% minutes, having covered over 20 miles across country without difficulty This flight was twice as long as that made by Orville Wright at Fort Meyer last summer in the speed test for the go ernment It is the longest cross-country flight ev made with a passenger, although it was not by any means as hazardous as the one made by Mr Wright. means as hazardous as the one made by Mr Wright.
Other flights were made with Mrs. C F Bishop, Lieut. Paul Beck, W R. Hearst, and a reporter for a New

· York newspaper For the second time Lieut Beck tried dropping dummy bombs upon a measured square on the ground While he did not succeed in hitting the mark, he came very close to it, and showed the possibility of dynamiting a warship or a town in this way Paulhan's last flight was way Paulhan's last flight was made with Mr Harmon as a pen-It was a cross-c flight of 8 to 10 miles lasting about mignt on a ... Hamilton made torse 20 minutes. Hamilton made torse attempts at high flying, rising to heights of 455, 300, and 700 feet, respectively The Gill Deach bit of the and respectively The Gill Dosch bi-plane was finally made to fly and was driven once around the field by Hillary Boschy In descending, however, it was badly damaged Curtiss made two laps, but was un ful in breaking his speed pecond

The last day of the meet, January 20th, Curties made the longest flight he has ever accor

Starting at 3.25 P M. Paulhan had made but two or three laps, when Curtiss went aloft about half a lap behind him Mounted on his Rheims racer Curtisis steadily gained upon Paulhau, and after making three laps passed him in front of the grand stand, his small biplane flying directly above the larger French ma-chine. This was the first real race the spectators had values. In a was users real rock in spectrum and witnessed, and Curtiss received great applause He continued to fiv around the course until he had cov-ered 30 laps (48 3 miles), his time being 1 is 39 Paulhan made 38 circuits of the course (68.5 miles) in 1 34 34 The average speeds of Curtiss and Paulin 14:44 The average speeds of Curties and Pauls aver respectively 37 at and 377 miles and Pauls Hamilton made a flight to Monesa, about 7 miles from the aviation Sidd. He rose to a height of swell hundred feet and disappeared from view upon the borizon. Upon his return the enablash of his motor-broke when he was nearly back, and he succeeded in glitting down to the field and alighting without mishap. A feature of the last day was a parade showing he avoid to 10 concention. The plands opened with an old-time "prairie schonner" and ended with the seroplanes.

TOOL FOR GUTTING STAY BOLTS.

Stay belts in locomtive boilers usually bree the inner side of the outside boiler sheet. W broken bott is in position behind the frame of the leco motive it is necessary to drill the bott on the firebox and drop it out of the way, after which a hole is bored

TOOL FOR CUTTING STAY BOLTS.

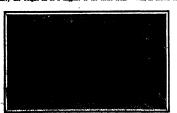

through the ginh in the optside sheet and the part of the bolt remaining is cut out with a round nose chisel.

This is difficult to do, and it sometimes happens that cet is grooved in the operation, and trouble is thereby With a view to overcoming this diffi caused thereby caused thereby with a view to overcoming this cities cally the tool illustrated in the acrompanying engraving has been invanted. It consists of a cutting member arranged to move in a sheath which can be fitted into the hole drilled in the bolt and serve as a guide not to acte or which is then operated to cut out the bolt. The body of the tool, which is of hexagonal form, is indicated at A Projecting from the body A is a blade B formed with a boad C at its lower edge. The sheath above referred to is indicated at D and rmed with a central bore to fit the bead C and s slot to receive the flat portion of the blade as indicated in Fig. 2. The sheath D is reduced at E to form a centering guide. The boit to be removed is form a centering guide. The boil to be removed in first drilled out, as indicated in Figs 3 and 4, to the diameter of the part B of the sheath. The portion B is then fitted into the bors, after which the outting tool is operated to drive the end F of the blade into the bott and cut it out as indicated in Fig 1. After the boil has been cut at three or four points it may easily be knotched out. Mr William Simits of Peaksuity be knotched out. Mr William Simits of Peaksuit of Pe tigo, Wis., has secured a patent on this new cutting

## UTILIBING CENTRIFUGAL FORCE PRACTICALLY

A Danish engineer, resident in New York city, Dr Albert C Albertson, has endeavored to turn to prace Albert C Alcoration, an encoavoree to turn to pre-tical use the enormous centrifugal force generated by a rotating body. His invention is at present embod-ied in an actually constructed and operative air com-pressor, with what success we leave our readors to judge from the accompanying illustration and the fol-lowing brief description.

In each of two parallel guide frames a block is ounted to reciprocate Each block is connected w meanined to reciprocate Exact nince is connected with the plates roke of a duplet compressor. Through the blocks an axie runs to the end of which is attached a weight-carrying arm. When the arms are thrown foreiby to one side or the other, each block moves back and forth, because the centrifugal force produced at the weighted end of the arms is endeavoring to carry the weight off at a tangent to the circle from

CONTRIBUTAL MARRIED 

its own center. But the center of each circle is the axle in the respective block. Hence the blocks move outward in their guide frames as the arms are thrown out. The angle bearings, center, arm weight are all therefore constantly changing position so long as the arm is being turned fast enough Each centrifugal arm in its flight does not describe a circle, but rather

ellipsoidal curve due to the shifting of the block an empeodal curve use to the suntaing of the broad.

The two guide frames, as has been stated, are placed parallel to each other, each having a block, arm, weight, etc. The blocks are held in opposite positions so that the arms will balance each other and so that the two blocks will always reciprocate in opposite directions

The means employed to hold the centrifugal arms in position, and yet allow them to follow their respec-tive "pulls," consists of a shaft between the guide frames with two crank arms, each of which has a pin extending into a slot cut in each arm. The crank shaft is driven by a small motor As the cranks turn, the contribugal arms are turned by the pins which project in the arm-slots. The greater the speed of the crank, the greater the power of the centrifugal arms Because there is no connection between the centrifugal arms and the cranks, the reciprocating action of the blocks is caused entirely by centrifugal force

It is a curious though easily comprehensible fact the amount of centrifugal force developed was so great in the machine illustrated that it was necessary to cut away part of the material of each arm and to reduce the weight so that the pistons would not ham-mer against the cylinder heads.

BRACE FOR BRICK KILFS.

During the process of baking bricks the kilns expand and contract, and if the sides are not braced after they have contracted they are apt to toppie over if the kiln should expand again. Hitherto it has been the custom to brace the sides of a kiln with tim bers and wedges which work involves considerable

BRACE FOR BRICK KILWS.

danger to the workmen while adjusting the wodges In order to remove this danger an inventor has rece iy davised the brace illustrated in the accompanying engraving It consists of a bar A formed with teeth along its upper edge One end of the bar is provided along its upper edge. One end of the bar is provided with a pair of studs adapted to engage a curved slot B in a supporting member O. The base of the support-ing member is made broad so as to provide a large bearing surface. The bar A enters a recess in the supporting member and is cut away at D so that when the supporting member is pressed against the kiln the upper edge of the base will dig into the wall, as shown in one of the illustrations. The tooth on the bar A are adapted to be en

gaged by a pawl S which is ful crumed in a member F that is supported on a timber disposed along the side of the kiln. The member F is held in place by teeth
G, which dig into the wood The pawl K is provided with a thumb plece H by which it may be lifted out of engagement with the ratchet teeth in the bar In using this brace the workman thrusts the supporting member C against the side of the kiln and places the member F in position on the tim-ber Then pressing against the kin with his foot he takes up the black between the two members C and F by engagement of the pawi S with the ratchet teeth on

the bar A. Mr Anatole Ferusse (care of J McLess 345 East Strand, Rondout, N Y ) has just received patent on this improved brace for brick kilns.

### BUTCHERP SCALE PAR.

It is customary for butchers to weigh meat in large scale pans that are usually provided with a rigid ball which is also of large dimensions, and the fact that the bail is rigidly attached to the pan makes it inconveni-The ent to slow away the pan when it is not in use accompanying engraving illustrates an improved form of butcher's scale pan in which the bail is so mounted that it may be fold ed down against the pan when it is

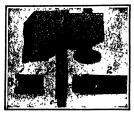

BUTCHERS SCALE PAR WITH FOLDING BAIL

not in use, but whenever desired may be locked rigidly in an upright position The ball is not directly con neeted with the pan, but to a pair of rails which serve to distribute the strain in our illustration we have lettered the pan proper A. Riveted to the pan at the bottom are a pair of diametrically disposed straps B which cross each other at right angles and are bent up at the ends against the sides of the pan rails C which are curved to conform approximately to the shape of the pan are secured to the ends of the Hinged to these rails is the bail B which is bars R provided with the usual book for attaching it to the scales. One of the rails U is formed with an outwardly projecting finings E in which is a square aperturadapted to receive a finger F that is free to slide  $\alpha$ magnetic review a major s that is free to state an the bail D. When the finger F is fitted into this aper ture the ball is held rigidly in upright position. On lifting up the finger F the ball is reveased and may be folded to the position indicated by dotted lines in the engraving Mr Jacob Feldman of 70 Carlton Avenue, Brooklyn, N Y, has recently secured a patent on this improved scale pan

### DOOR SECURER

A very convenient device for securely locking doors has recently been invented which should be of par-ticular value to traveling men who often find it necessary to occupy a bedroom not fitted with an efficient lock. The locking device may readily be applied to any door without marring it in the least. As shown in our illustration, it consists of two plates. larger plate A is provided with teeth which The placed against the jamb of the door and when the door placed against the jamb of the acoor and when the door is closed on the plate it forces these teeth into the wood. The opposite end of the plate A is turned back upon itself to form a hearing C the purpose of which will presently be explained A square opening D is cut through the body of the plate A and adjacent this opening a cam or occuntrically mounted disk E is provided The second plate, as shown in Fig 3, is formed with bearings F adapted to fit at opposite sides of the bearing C and receive a screw that passes through the bearings of both plates, being threaded into one of the bearings F. The smaller plate is also provided with a lug O which projects through the open

SIMPLE DEVICE FOR SECURISE DOORS.

ing D in the plate A. The lug G is recessed to receive the cam E, and the latter is turned to press the step Hagainst the door and thus lock it shut. In order to allow for the movement of the smaller plate as the cam N is turned the bearing C of the larger plate is clongated as shown in the drawing. The inventor of this door securer is Mr Charles W Lent of Tingley,

#### AW OIL CAN

The oil can illustrated in the accompanying engrav ing belongs to the class embodying a figible bottom which is operable to cause a flow of oil The construc-tion here shown, however, is arranged to provide a considerably greater flow of oil than is obtainable in sourced by providing three disphragms in the can, one of which serves as the bottom of the can, while the other two are connected at the center by a nipple Ir this manner an oil chamber separate from the main portion of the can is formed in the accompanying engraving the can is shown at A with the usual nozzle B threaded into the upper end Fitted into the lower end of the can is a retaining ring C which has er ing flanges at the upper and lower ends and is also but outwardly at the lower end to fit against a shoulder formed in the can body. The dished dis shoulder formed in the can body. The among an applicaging I and E bear against the flanges of the retaining ring. The two disphragms I and E are connected at the center by the nipple I. The disphragms or bot tom F is soldered fast to the can body. An oil chamber is thus formed between disphragms F and E. In operation when the bottom of the can is press ward it drives the oil from the oil chamber with greater pressure than would be the case if the entire can body formed a single oil vessel. At the same time

TRIPLE-BOTTOMED OIL CAN.

the other two disphragms yield as well, thus effecting a large discharge of oil Mr Frederick G Svetilk of Cadott, Wis , has recently secured a patent on this improved off can

### AUTOMATIC WASON BRAKE

Two patents have recently been issued on the sub ject of wagon brakes, describing a form of brake for use on carriages and wagons, that will be automatically applied when the horse is checked or presses back against the load when going down hill. The brake may also be applied by hand and can be thrown orace may also appared up and and can be chosened to back the vehicle. In order to take off the strain upon the mechanism when traveling around curves or over rough roads, a fiexible connection is made between the tongue and the brake mechanism. In Fig. 1 the tongue cated at A It is provided with a crowned roller B mounted on a vertical axis which bears against a crown roller C mounted on a horizontal axis. Th roller C is carried between two arms of a brake reach D which are disposed at each side of the main reach E and are free to slide longitudinally in the hounds. The brake reach D is connected at the rear end to a lever F which is connected by chains to the brake beam G. The intter carries the brake shoes that bear against the rear wheels of the vehicle The brake beam is connect rear wheels of the ventue The brake beam is connected by a spring to a post H carried by the main reach E It will be evident that when the tongue is pressed backward or when the vehicle rides forward on the tongue the brake reach will throw the lever F back ward, drawing the brake shors into engagement with the rear wheels. A hand lever extends upward from the rear wheels. A hand lever extend upward from the lever F to permit of operating the brakes manu-ally in order to throw the automatic mechanism out of operation the tongue A is locked to the hounds by means of a simple mechanism. It consists of a lever

I with a downwardly projecting flange adapted to en-gage a flanged piece J carried by the tongue. The lever I is mounted in brackets secured to the hounds lever I is mounted in brackets secured to the sounces and is normally spring-pressed out of engagement with the piece J A cord running from the lever I to within convenient reach of the driver may be drawn within convenient reach of the cirver may be drawn upward to throw the lever I, whereupon a latch K will engage a stop piece sorving to hold the lever in sot position With the tresspice J set as shown in Fig 1 it is possible to lock the brakes against the

AUTOMATIC WASON BRAND

wheels, while if the piece J is set with the fiange at the opposite side, as shown in Fig. 2, it serves merely to lock the tongue to the hounds in such position that it cannot set the brakes.

The second construction referred to is similar to that shown in Fig. 1, and corresponding parts are re-ferred to by the same, but lower-case, letters. The tangue a is connected to the brake reach d by means of a chain b which passes over a pulley? The brake reach d is connected to a lever f which in turn is connected by means of chains to the brake beam g. The brake beam is connected by a link to the main reach e, and is held in inoperative position by a spring attached to the brake reach d. The hand lever for operating the brake is shown at h. A locking device similar to that shown in Fig. 2 is indicated in Fig 4 compr a lever i mounted on the bounds, a lug j mounted on the tongue and a latch k. The inventor of these wagon brakes is Mr. Ebon G. Dolan of Starksboro, Vt.

### ODDITIES IN INVENTIONS

Імевочко Вног Втактенка trated herewith is so arranged that it may be adjusted for stretching shoes of different sizes and shapes, and for applying the

shoes to a com-fortable fit. The

stretcher is pro vided with a sta

per end, which terminates in a

tionary base, formed with an IMPROVED SECR STRETCHER. knob. Fulerum

is a bell-crank lever, one arm of which is also provided is a beli-crank lever, one arm of whith is also provides with a knoh, mating that of the Kned arm. By depressing the beli-crank lever, the knobs will be forced apart, stretching the shoe at the points of contact. These knobs are removalles, and are provided at one icle rounded and the other projecting Each knob size has a square tappered opening adapted to fit the arms of the shoes stretcher. The knobs may readily be and the shoes are contacted to the shoes stretcher. The knobs may readily be and the shoes stretcher. The knobs may readily be and the shoes stretcher. plied, either with the projecting portion bearing against the shoe, or with the rounded portion, as de-

ventor has recen ly procured a pat-ent on a device rocking for chairs, without placing the feet on the floor The particular advantage of this scheme is that a slight movement of the feet will of the reet was cause the chair to rock. Fulcrumed to the rockers are a pair of levers

fitted with reflers at one end to engage the floor, at the opposite end connected by means of links to a pair of bell-crank levers forming a sort of a treadle. a pair or conservant system turning a sort or a treatment on which the operator's fact are supported. By press-ing this treadle downward, pressure will be brought to bear on the rollers, causing the chair to rock. When desired, the mechanism may be thrown out of opera-

tion by folding the treadle up against one of the

pieces of the chair

Boctaring Orisanal Rugs,
Of the hundreds of thousands of dollars worth of
Oriental rugs brought into the United States anneally,
many of them are what is known to the profession
as "wander rugs." This means that brightly conforOriental rugs are sometimes washed with a solution
of chloride of lithe, a treatment which partly bleaches
the colors and imparts a soft appearance to the rug. the colors and imparts a soft appearance to the rag. The chemical treatment is a precess of washing which produces the effect of age and a peculiar sheen to the surface, which is pointed out by many dealers as a proof of superior quality. The fact is, however, that the process of washing invariably weakens and in some instances destroys the materials of the rag. The progressive refer to of the chemical treatment of the progressive refer to of the chemical treatment of the progressive effect of the chemical treatment of the rung is this The chlorine gas contained in the ceberide of lime attracts oxygen and moisture from the sir, sy which muritait said is formed. This eats away the vitals of the fabric. Sconer or later the wool and cotton in the rung become britis, and thus weaken the warp and deteriorate the wool. When this deterithe warp and desertorate the wool. When this deter-oration is complete, the pills of the rug may be awapt away by the ordinary process of awapting, and the warp, which is the foundation of the rug, becomes so weak that boles appear here and there, and soon the rug is worthless.
It not seldom happens that a Persian rug is too

glaring in some bright hue, porhaps red, and is not salable. An unscrupulous dealer will subject the rug to the series of washings in chemically prepared watto the series or wasnings in enemically prepared w in this way he turns out a rug possessing a soft tique sheen that is truly captivating, and finds a re purchaser for the doctored floor covering sing a soft an

#### A New Comet Discovered in South Africa.

A new comet visible to the naked eye was discovered at Johannesburg on January 16th by Innes, in right cension 19 hours, 60 minutes, 28 se tion minus 23 degrees, 59 minutes 24 seconds.

At the time of its discovery the comet had an hourly motion in right ascension of plus 41 seconds of time and declination of plus 6 minutes 4 seconds of arc

The comet discovered is brighter than Venus. At Lick Observatory it was easily seen with the naked eye at noon about four degrees east of the sun and onehalf degree north of it, moving northeast

For a few nights the comet was a brilliant object in

the clear southwestern sky just after sunset. Readers of the Scientific American will hardly con fuse .bis comet with Halley's, which has been the ob-ject of constant study since September 11th, when it was sighted The South African body is one of the two or three comets which are usually discovered SVOTE TOST

Dr Joseph K. Pogue who is in charge of the Divi recently described in the Smithsonian Miscellaneous Collections a remarkable specimen of pyrite studded Collections a remarkable specimen of pyrite studded with crystals of gold and party covered with plates of galean from the Snettlebam district near Juneau, southeast Alakas. The pyrite is in the usual form of a cube, but what is very remarkable is that there are not it more than one bundred and thirty well-defined crystals of metallic gold. These are also in the cub and system and from one-third to one-half burded in cal system and from one-third to one-half buried in the pyrite, never more, and seem to have no definite relation to the crystallisation of the pyrite. Similarly, crystals of galean and chalcopyrite are found on the pyrite. The structure and relation of the galean to the pyrite is of considerable scientific interest and is described in technical detail by the author. This very unusual occurrence of these minerals in crystallo-graphic juxtaposition is described by Dr Pogue as follows. "The pyrite, when its present size was nearly attained, sustained a deposition of crystallised gold maximed, sustained a deposition of crystallised gold upon its surface followed by the precipitation of small amount of chalcopyrits which, in turn, was su-ceeded by the formation of the galena. A further slight accretion of pyrits completed the development of the specimen.

Failure of a fly-wheel, says Power and the Engineer, usually begins by the starting of a minute creation the under surface of the rim at the point of greates stress, vin, near the ends of the arms adjacent to the screen, vm, hear the each of the arms acquest to the rim joint. The create gradually deepen quilt failure occurs, with all its disastrous consequences. These minute creates are visible to an experienced eye, and careful impectings will did metarishing in the prevention of fly-wheel explosions.

(Concluded from page 100)
Atlantic type and the six-coupled type Attantic type and the six-coupled type which succeeded it in fast passenger service. Commencing at the tender, which is of huge size in itself, we note that it is carried on two six wheel trucks, a novelty is tender construction. The tank capacity is 4,000 gailons of oil and 12,000 in the fire tubes, and 1,279 square feet in the feed water heater tubes, making a total of 4,756 square feet. In the super

total of \$,750 square reet. In the super-heating and re-heating section there are 1,121 square feet of tube surface. The firebox is built up of steel plates, finneed to a channel section and rivoted together with stay plates riveted in be-tween the opposite flanges of the outer and inner shell. The fire tubes, 21 feet long, terminate in a combustion cham ber, 10 feet, 9 inches long, which con-tains the super-heater and the re-heater The front combustion chamber, which forms the feed water heater, contains 417 tubes, 214 inches in diameter by 6 feet inches long
The boiler with its superheater a

feed water heater extension is connected rigidly to the frame in which are car ried the pair of trailing wheels, the six coupled drivers, and the high pressure cylinders. The low pressure cylinders, the forward truck and the four coupled drivers are carried in a separate frame and the weight of the forward portion of the boiler, feed water heater, etc. is carried upon this forward truck by means of two sliding bearings which allow the frame to move laterally under neath the boiler, as the locomotive enters upon a curve This necessitates employ ing a flexible steam pipe for conveying the steam from the re-heater to the low pressure cylinders and the necessary flexibility is secured by using both slip and ball-and-socket joints in the steam plps Platon valves are used who countries and the valve motions are of the Walschart type There are two high pressure cylinders, and the valve motions are of the Walschart type There are two high pressure cylin type by 28 inch stroke, type Inser are two high pressure cylin ders 24 inch diameter by 28 inch stroke, and two low pressure cylinders 38 inch diameter by 28-inch stroke The driving wheels are all 73-inch diameter

The general construction of the freight to the passenger ocomotive, but the dimensions, weights locomotive, but the dimensions, weights and power are, of course, much greater. The boiler is 7 feet in diameter, works under a pressure of 220 pounds, and has a total heating surface, including the feed water heater, of 6 651 square feet. There are also 1,746 square feet of super heating and re-besting surface. There are the heating surface. high pressure cylinders, 26 inches in diameter by 34 inch stroke, connected to eight-coupled drivers 63 inches in diam eter, and two low-pressure cylinders 38 inches in diameter by 24 inch stroke nected to eight-coupled 63 inch dr nected to eight-coupled 63 inch drivers The tender contains 4 900 gallons of oil and 12,000 gallons of water The engine alone wolshs 2214 alone weighs 23114 tons, and the engine and tender together weigh 350 tons. The total pull on the draw bar maximum

ower is 54 tons.
It is no exaggeration to say that these locomotives mark a new era in American locomotive practice, for although the Mallet system, super-heating, feed water ng and compounding have been tried out senarately on various locomotives, this is the first time that these refinements have been embodied so com-pletely on a single type

Home-Made

**Experimental Apparatus** 

if there is any neivertife, mechanical, or en-ineering subject on which special information i desired, some papers will be found in this stalegree, in which it is fully discussed by supposed authority compass agreeity
A few of the many valuable articles on the
making of experimental apparatus at home are
given in the following like
ELECTRIC LIGHTIMS FOR AMAZURUES
The article talls how a manil and simple experimental installation can be set up at home
felentific American Supplement 1531.

AN ELECTRIC CRIME AND HOW IT MAY
RE CONSTRUCTED AT HOME, is described in CONSTRUCTION OF AN ELECTRIC AN SUPPRIMENT INC.

EOW TO MAKE A 100-MILE WIRELESS

(Continued from page 113) lately, it has been quite rapidly of late

quite rapidly of late
In looking for a comet one must not
be too credulous, and think that the first
object he sees is a comet Many times I
thought I had found the comet and could see even the tail, but it proved to be rely a star clongated by the shaking of

the telescope

Now the same manner of proceeding may be applied when the comet is near any other star, though it will not soon be so desirably located as on the evening of November 10th After the comet is November 10th After the comet is bright enough so one can see its tall and head, one would not need to go to so great trouble but could systematically search a limited and definite area near it, and in a short time would be able to pick it up But it is not expected that it will be a very conspicuous object in a small telescope before the close of winter or early spring in the meantime the ambitious smateur astronomer can satisfy his interest by studying it in this man

As an aid to those who may wish to try this plan, it may be observed that the evening of February 5th is favorable because of the comets proximity to Epsilon Piscium Epsilon Piscium is in R. A. 0 hr 58 min, and Dec 7 deg 24 min From the ephemoris given for February 5th the the ephemoris given for February 5th the following is its location on that evening R A 0 hr 57 min, and its Dec +8 deg and 11 min Similarly it will be found close to Delta and 62 Piscium on Febru ary 17th, and March 6th it will be just north of 5t Piscium Rs motion is much slower during February than for the two preceding months, and so its location ought to be an easy task for the evenings odiately before and after these dates

Where the neighboring star is not as conspicuous, as in the case of Aldebaran one must study the constellation and familiarize himself with the stars in it ntil he can locate the flesired star is often somewhat tedious, as a few weeks ago, when I tried to locate it among the many small stars in Taurus directly above It is, however, a helpful study

I had a very gratifying and profitable s inso a very grantying and profitable study on the evening of January 14th, as may be seen by the cuts January 15th was the evening of nearest approach to Omicron Piscium, but as this was a cloudy night I decided to try the following night I had searched but a moment or two when it appeared in view I have seen it two or three times since November 30th, but it has never appeared so dis tincily as on this evening It is still faint, though but a few seconds of are in sixe, and could be easily passed over if the observer is not careful It looked if the observer is not careful. It looked more like a small nebula. I could not state definitely but it appeared as though it had a faint nucleus. But the most It had a hant nucleus. But the monitoring gratifying result of the evening's study was the unmistakable motion detected as is clearly shown in the cuts Stars A and B were about twenty minutes of are apart. The amount of motion could not be determined accurately with the 45-power, and the comet is still too dim to use the higher powers. I have had no further opportunity as yet to pursue this phase of the study but shall at the earli-cat possible moment. It will suggest a problem for other amateurs. I anticipate for many other amateurs as much delight in the scrutinizing of Halley's comet as I have already had

It is estimated that the German Empire has nearly 35,000 000 seres of forest, State German forestry on scientific lines has resulted in raising the average yield of wood per acre from 20 cubic feet in 1830 to 85 cubic feet in 1904 During the same period it has trebled the proportion of the sawn timber secured from the aver age cut. In fifty-four years it increased the money returns from an average acre of forest sevenfold, yet to-day the forests are in better condition than ever before

NEW YORK, SATURDAY, FEBRUARY 5th 1910

The follow is always plad to revolve for examination illustrated article on subjects of timely interest. If the photographs are sharp, the article short, and the farin authorate the contributions will receive special attention. Accordant articles will be paid for at regular space rates.

#### LESSONS OF THE PARIS FLOOD

I is rather surprising that in all the voluminous descriptions of the Paris Bood, which have been published in America, there has been given no complete analysis of the meteorological conditions which have turned the unually gentle and tractions which have turned the unually gentle and tractions and the properties of the sense united that any mere ratinful in the watershed of the below could have been sufficient in the watershed of the below could have been sufficient behind that the present such that the sense of the below could have been sufficient belief that the start part, if not the major part of the Bood water, is due to sudden multing of the snow in the mountains and on the higher levels.

Apart from the extreme suffering and personal love. Apart from the extreme suffering and personal love apart for the calanity is the disastrons reflect which expect of the calanity is the disastrons reflect which must surely result from the loundation of the foundations of the city, and the fooding of its labyriath or situation of the city, and the fooding of its labyriath or great depth pressure and violoty it is a fact, well understood by confineers and architects, that foundation material which is perfectly stable in the dry condition, may begin bee much, if not all, of its supporting power when it becomes saturated, and particularly, it is in the present case, the ground adjoining the condition in full of such voids as are represented by subways, severs, colars and other excavations A subtartatum which will remain stable under normal conditions, may begin to flow or side when it is saturated, in contrast will appear in the superincent with, it indeed the building his not thrown

Parthermore the cabled reports, referring to eaving streets, burstless savers and rollegating subways, indicate that another most destructive action of the water must be actively at work. We refer to the subterrance in the substantial of the

Inquestionably, one result of the flood will be the moderathing of public works designed to prevent any resettion of the disaster. An obvious plan would be to build a masony resisting wall, or leves, throughout the whole length of the city and for some distance above it, earrying the work to a height sufficient to purcent any future overflow. So enormous has been the volume of water that has come down, that unless the value were sarried to an inconvenient height, the country of the control of the property that sould have to be condemned for this purpose would seem to be not of the quantity. There can be little down that the overflow at Three on the little down that the overflow at the control of the control of the property that sould have to be condemned for this purpose would seem to be out of the question.

There can be little doubt that the overflow at larks has been greatly increased by the presence of so many mesonry bridges, each of which embodies overall bears mesonry pleas that greatly reduce the area of the channel, and if the municipal engiments underlinks a sufficient enlargement to above

# Scientific American

intely prevent future overflows the beneation of the obstruction presented by these bridges must surely come up for consideration Judging from the reports it would seem that not only the piers, but the superstructures of the bridges themselves have served to dam the waters and split them over the adjoining

#### THE NEW YORK DEEP TURNEL WATER SUPPLY.

WUGED from the standpoint of sound engineering and practical utility the plan to carry the new five hundred mittion galion per day Catability water supply through the length of Manhaia Island in one large deep tunnel, cut through the everausting rock, is one of the most commendable projects ever brought before this (iv, and we feel that a strong protest should be made against the attempt to discount of the control of the c

certain more or less interested parties.

It is unfortunately a fact that in this age of sensationalism there is no more fruitful field for the pasticular than the result of the pasticular than for bandlevalt uses only by the curb and but them for bandlevalt uses only by the curb and but the more bandlevalt uses only by the curb and but the pasticular than the

to the proposed tunne, which will vary in diameter from 11 to 18th, from 110 to 18th West leverton 1 to 18th, from 110 to 18th West levervolr near Yonkers, below the Bronx, the Harlem River,
and throught with the full length of Menhattan leads,
and thence, below the East River, to a terminating
point near the Atlantic Avenue Station of the Long
leiand Railroad From this point pipe times near the
surface will extend under the Narrows to Staten island

and northeast into Brooklyn
At the Bill View Reservoir at the north a 300-foot shaft will be sunk, from the bottom of which the great tunnel will be driven to the scott it will be constructed at sufficient depth (spoterally from 150 to 200 feet) to insure its lying everywhere in rock sufferies to the preservoir of the water, and as a further suffequard, it will be lined throughout its length with concrete The total length of the tunnel will be seventeen and one-half miles and at 4 000 feet intervals construction shafts will be subtracted when the job is completed these shatts will serve as uptake shafts, with connections to the surface system of pipe distributions of the surface system of pipe distributions.

tion must valuable advantage of the deep tunner matched is that in Lower Mantata, Brochus and matched is that in Lower Mantata, Brochus and Blaten alend, the water will be delivered at a greater elevation by about 100 feet than would be possible if the surface pipe lines were used, and water will be adjusted to 120 feet above tide level. This great difference is explained by the fact that the frictional read and extending the shole mass of water in one large single conduct. Other advantages are that, since the tunnel can convey as much water as thirty 4-foot pipes, the cost of construction and the annual charges will be should be accurately as the same charges will be should be accurately and the same charges will be should be a great coloured or being sensely for reads, that there will be impossible; that there will be a great coloured or subsequently for reads, that the prevent of the control of large configurations, and leastly, that by cross-connection of the tunnel with the existing water-supply system, the latter can be antequalized against any executed of the region of the reads of the control of the reconfigurations, and leastly, that

#### OUR LATEST AND PUPAL REGISEROMATION REGISE RATFLESSIF.

HERBH is no descript the fact that the Back Town of the Community of the C

The "Delaware," which is a sister ship to the Aorth Bakota, "is identical with that vessel in everything but modive power. She is driven by two verticals forcerylinder, triple-expansion engines, which embody the very latest developments of the type, with piston valves, forced subrestation and shap rotational speed. Sizani is supplied by water-tube bollers, running under the contraction of t

The contract called for the development of \$5.00 maximum horse-power and a speed of \$1 knots. In the trials the engines developed a mean horse-power, on the varies over the mile, of \$2.50 '3 and a mean speed of \$11 knots. The maximum horse-power developed to a single mile was \$3,000, and the maximum speed \$1.98 knots. Interest, naturally, centered on a comparison of the performance of the "Delaware" instements of the performance of the "Delaware" instements with that of the "North Dakots' turbines, because the performance of the "Delaware" instements of the performance of the "Delaware" in the performance of the "Delaware" have maximum to the performance of the "Delaware" showed a superior efficiency at all speeds in the consumption of steam. Now, white superior rule economy may be and its often affected by the quality of the coal and the degree of skill of the fireman, and, therefore, may be credited more to the stoke-hole than to the eighte room, the steam or water consumption is determined aimont entirely by the efficiency of the engine, and it is on this last basis of comparison that the endea the "Delaware" have made such a remarkably meant the "Delaware" have made such a remarkably meant the "Delaware" have made such a remarkably meant the performance of the p

fine showing.

In the 24-boar run at 19 knots the 'North Dakota' burned 295 tense of cast, with a water consumption of 1957 pounds per horse-power per hour, and the 'Delaware' 315 tons with a water consumption of 1458 and 18 knots the 'North Dakota' burned 185 tons with a li li knots the 'North Dakota' burned 185 tons with a water consumption of 23.94 pounds, and the 'Delaware' 111 tons with a water consumption of 23.94 pounds, and the 'Delaware' in 10 tons with a water consumed per hour 'The total water consumed per hour by the turbines of the 'North Dakota' at 12, 19, and 21 knots respectively was 15,000 pounds, 23,500,00 pounds and 38,000 pounds and 186,000 pounds from the 'Delaware' for the main engines was 5,500 pounds and 38,000 pounds and 31,000 pounds. These figures, considered on the score of steam economy, are greatly in favor of the reciprosating segion, and they indicate that the cruiting radius of to "Delaware's consideraty larger than that of the "Delaware's consideraty larger than that of the "Delaware's consideraty larger than that of

Why then, it may be saked, is the government committing itself to the steam turbine as the drives for future battleships? The answer is, first, that the Theologies' turbines have been greatly improved upon in later models. The number of expansion stages has been increased, and the steam economy in the sent possible of the steam of the steam of the steam in the steam of t

The French Deputies were presented recently with specimes of the new aluminium coinage with which it is proposed to regime the Promes coins in France. The 10 conjuling piece is described as "complaint where a country and a torquer better," and in half to be even Jess attractive in appearance that a block to be a support of the proposed of the propo

## ENGINEERING.

An superineedal road has been constructed at Truro, which it is claimed has the advantages of being registant, must not dust proof, noiseless, and requiring an removal of the old surface. It consists unsides, down on the roadway sheets of expanded steel striffer to those so largely used for the restorcement of concrete, and laring over it 2 a finch depth of ord-Paper, road material treated with coal tar, and rolling

The final plans of the new Arguettae dreadnoughts have now been passed. The stripe will be called "Rivi-davia" and "Moreno". They will be of 26,000 tons distributions and arry twelve it inch, review 5-inch, and twelve 4-inch guns. The speed will be 22 knots There will, it is said, be two funnels and two skeleton masts of the new American type. The whole of the twelve guns will bear on other broadsie. The contract for these ships has been swarded to the Forn River competition for this order mone, the leading ship-builders of the world, the securing of this contract is a high tribute to American highlighting.

a high tribute to American shipbuilding American Company has been organized to build a line from Testutian, State of Puebla, through the State of Venezuru, to the port of Nautia, says the Mexican Herald The \$2,000,000 gold capital has all member of the board of directors, says that the line member of the board of directors, says that the line control of the test of the control o

According to the United Service Gasetie, the first airship for the Brittien sary, which is now being built by Vickers, Sons & Maxim, will be the largest reased of the kind in sustence it will be over 600 feet in length and driven by two motors of 200 horne-power each, which will be capable of driving the vessel at 6 miles an hour is still air. The nominal litting in this authority, will not exceed let vome it in a first problem of the property of the propert

There are over 400 miles of railway now in operation in Guaramala and various extensions are in proport. One of three contemplates the building of a line from Zecapa on the Northern Railroad, about miles from the sea, to Santa Ana, on the northwest are frontier of Salvador, where it will connect with the British railway already built, and thereby with the april at Salvador. Much of the roften one with in that republic will thus find an outlet to the Atlantic of which it has long been in seed, and it is high probable that the built of the import trade to Salvador will also be conducted along this route

In his first annual report, Secretary of the Nary Meyer ando for only two hattleships and one repract ship. These battleships he recommends about the order all-bigs. These battleships he recommends about the order all-bigs. Type They will complete the squed on of eight vessels of that type A repair ship is accumely desirable, in order that the flest may be made more solf-austaining. Mr Meyer favors the building of practically all the new vessels under contract with private shipbilliding concerna, not only because these industries should be fostered, but also because the construction is more secondical when done by private concerns than at the government many yards.

There is a bill before Congress providing for a boad base of \$10,000,000 for entrying on the work which is now under construction and contemplated by the Bulled State Reclamation Service A complete description of this noise project for bringing under culturation arid and semi-arid regions of the West was given in the Middle West Number of the Eurarymet Ausman of December 11th, 1969 It is exposed that by the close of the next year about two million serves will have been reclaimed at a cost of \$70,000,000 will have been recovered and opened for seltiment.

have been recovered and opened for settlement.

#### SCIENCE.

During the month of January, 1910, four comeda were at one time in the heavens. The first of these is Halley a comet, the second Winnecke a, rediscovered at the Observatory de is Piata on October Slat by Poro, the third is Daniel's, and the fourth inness."

The Austrian Ministry of Public Works is trying to settle upon a place where radium may be sold, and the price to be charged. The question cause up when a quantity of ore shipped from Joschinstinia was found to contain no less than one gramme of radium. The price of this small quantity has been fixed at 189 cross as (877.1) a milligramme. Those who centers the property of the property of the property of the tred at 1the Ministry of Public Works in order to receive information as to quantities and current prices of radium.

Dr B G Acheson was presented with the Perkin medial at a recent meeting of the Chomists (Tubb in presenting the medial Prof C F Chandler traved the history of the decreation and told how it had been conferred upon fill William in Perkin, Dr J B Francis Hermshoff, and Dr Arno Behr J A Acheson received the programment of the Perkin Professional Conference on the Perkin Professional Conference and now indispensable to the world The substances with which Dr Achesons name is associated are carboroundum, deflocculated graphits, and Engrithanized citys.

The New York Aquarium had a greater number of vatiors during the year 1906 than ever before, the altendance being 3,803 501 an average of 10,417 a day These figures show that the Aquarium has a greater patronage by the public than all the other museums of the city including the Zoological Park combined, and 1,800 500 more, for the same period than the New York Hippodrome which has probably the largest attendance of any theater in the city. These flatures are not also the combined of the combined of the city of the combined of the combin

The first spectroscopic observations of lithleys comet, made at Meudon by Desiandres and Berand, reveal clearly marked discontinuities in the spectrum of the count of the faint certinuous spectrum is excussed by distinctly stronger lines capecially in the ultraviolent region on December fifth the cumet showed a nearly circular nucleus from which extended two curved rays of feelib brillians, but distinct, and rescubling in form the antenam of an insect or the promps of a two-promps of the proposed of the comet is proposed to the diminished. These first observations show that the count is airready self-luminous and that the light is due partly to inconderson gases.

askered, whith separate to be reviously varied animals of the built between the control of the built between the bound of the Bolton of the Paris observatory. In examining a being discourable made on Covicher 19th Bolton observed as he tall linear trace. As the star images on the plate were perfectly round and sharp, it was evident that the trace was either a defect in the photograph or the impression made by a plant in order to verify the observation, another photograph of the same part of the sky was made on October 23rd. The second plate showed the trace, a little to the southwest of its former which appeared to be of the eleventh magnitude. The discovery was immediately reported to the astronomical bursau of Kiel, where the adversid was provisionally designated by the symbol 1899 J. D. Blince the remarkable discoveries made by the tierary brothers the search for sateroids has been carried on almost exclusively by German and America astronomers.

The Treach journal Le Radium describes a long series of experiments made by Blanc, of Rome, in regard to the presence of thorium in various earths and rocks. The proportions of thorium found expressed in millionths of the weight of the mineral, were as notions. Those reportions are thorium found expressed in millionths on the weight of the mineral, were as the contract of the con

# A NEW STORAGE BATTERY STREET CAR

## ANOTHER EDISON INVENTION.

The announcement was made about nine years ago that Thomas A Edison would soon place on the market a storage battery that would be much lighter and of greater capacity than the usual battery and provided with positive and negative elements that would not deteriorate because in place of an acid an alkali would be used for the electrolyte Much was promised

showed no serious effect when rapidly discharged, no damage resulted from overcharging Shortly after the batteries were placed on the market it was found that the graphite became oxidized and interfered with the output. After considerab le research it was discovered that chemically pure nickel could be substituted for

ous one. They had to be about the size of a leaf pub-cil, namely, quarter of an inch in diameter and flour inches iong, with the sides finely perforated. A ma-chine was eventually built which made the tubes out of perforated nickel ribbon. The ribbon was wound spirally with the edges of the coils interiodox and flast-

a radical departure from common practice

Interior of the car with the scats raised to show the batteries placed in the steel girders. A NEW STORAGE BATTERY STREET CAR

for this battery, and a year or two later it appeared The positive element consisted of nickel exide inter-spersed with layers of graphite and packed in perforspecies with agone of graphics and packed in perior-ated nickel tubes, while the negative element con-sisted of iron oxide and the electrolyte was potassium hydrate. Both elements were supported in nickeled steel grids. The battery weighed about half that of the usual storage battery of the same capacity

But soon another difficulty developed. The nickel was packed in tubes of square cross section as would buckle or bulge outward, permitting the pow dered nickel oxide to filter down over the pure nickel layers and insulate them Then it was determined that a round tube would have to be used which withstand the pressure of the nickel oxide The lem of producing such tubes economically was a

amount of money was spent in solving this one prob-lem of the battery.

iem of the Dattery.

Shortly after the batteries were first put on the market they were withdrawn on account of the defects above enumerated, and about two years ago when ttery was finally completed in its pr a large number were sent out to be tested on auto-

# ARTIFICIAL PRODUCTION OF THE VOICE

## BY JACOUES BOYER

Dr Marage has succeeded in demonstrating, by nu merous experiments, that the voice results from an intermittent vibration of the larynx and the air with in it, reinforced by the resonance of the mouth and other cavities situated above the larguz in a recent communication to the Paris Academy of Sciences, Dr Marage supplements this demonstration by proving that the largux alone suffices for the production of

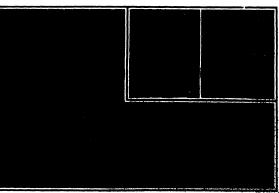

these vibrations In the first of these later experi ments, performed on a living person Marage succeeded in nullifying the action of the hec-cal cavity by fill ing the mouth with 'steut,' a substance which is used by ing impressions of the mouth The steut which filled the mouth was traversed by a ri gid tube which connected the lar-ynz with the external atmosphere Al though the resonant cavity of the suppressed, the five laryngian vowel sounds OO, O Ab,

enunciated distinct-ly by the laryux The investigation was continued by endeavoring to pro-

Ay, and Ee, were enunciated distinct-

from a larynx detached from the body Muller had already experimented with the dead and isolated iar yaz, but the sounds which he obtained were quite different from those of the living larynx, and he stretched the vocal rords by applying forces much greater than the muscles of the larynx can carer These forces, which is nome excess exceeded a weight of 24 pounds, would certainly have torn out the aryte-

noid cartilages of a living human larynx. Hence the conditions of Muller's experiments were abnormal Marage employed, in his superiments, the larynx of the day in order to spare the animal useless suffering, morphice was first administered hypodermically and, three hours later, the dag was put under the influence of chilorotors, and the larynx, with other the influence of chilorotors, and the larynx, with or or six rings of the traches, was excised. # WHAT SMOKELESS POWDER HAS MADE POSSIBLE.—I.

BY ROBERT G. SKERRETT

Emospi for saluting purposes, where smoke making its a factor in the ceremony, smokeless powder has sup-

gas a necoy in the ceremony, minuscens power mas sup-planted the older propellant.

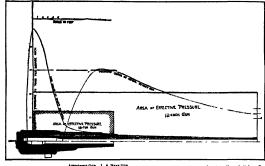

Our biggest battleships could not be given their present powerful armaments had not smokeless pow-elver made it possible to add to the destructive force of our guas while calling for much less weight per unit of energy than formerly

Smokeless powder was first generally used in the Fresch navy at the time of the devolument of rapid fire guns to repel the swift torpedo boat. The use of ly gun powder in those weapons would have biansmakly mm powder in those weapons would have blan-ished the defensive vessel in a cloud and have given a greater chance of success for the torpedo bost. Thus, a milktary necessity demanded the change One-de-valsied, however, mucholess powder became the step-bring stone to a revolution in ordenance engineering. This was due in the main to the differences between the physical actions of the old and the new proposi-tion of the contract of the contract of the contract of the properties of the contract of

Black gun powder has a very dignified antiquity It is a mechanical mixture of saltpeter, charcoal, and sulphur Smokeless powder, on the other hand, is a chemical combination in which the atoms bear a different and a far more intimate relation to one another Common gun powder is a violent explosive and other Common gua powder is a violent explorive and separate its gases with great suddonnes its grains, however, when burned in a confined space are only imperfectly command, and large volumes of smoke are guestated. When used in guas the products of are guestated. When used in guas the products of present the production of the product of the class of the product of the product of the same of the product of smokeless pounder, the charge was short half its weight of the prejectific-double the quantity of smokeless powder required to give the same shallated results Black produce seattle

a very great and disproportionate stress upon the breech of the gun. Thence toward the musie, the present of the gut. Thence toward the music, the presents drops suddenly-capecially if the grains be small and the mass thus easily inflamed Our dia gram shows graphically the quickness with which the highest pressures are developed and the rapid way in middle of these units so that as the consuming flame reduced the outer surface the burning area of the hole was increased, maintaining thus a relative balance of ignited surface and giving a more regular and gradual

dealing with the briefest fractions of a second of time, but measurable intervals that mean everything to the Ordnance engineer
Higher velocities and better ballistics followed But

generation of gas. For a time, this answered But generation of gas. For a time, this answered But the gun grew, and the exposed surfaces of the greater powder charge required effered too large an initial burning area, and dangerously high and sudden pre-sures were produced at the breech of the weapon.

there was actually more smoke than before, the bores of the guns were quickly fouled and there still re-mained a wasteful percentage of unburned grains Such was the state of the art in this country when we went to war with Spain

Weight of gen., 60 teens Weight;nof shell, 1600 pounds ; Powder charge, 505 pounds ; Munic velocity, 5,600 feet per se nal . Missaale energy #8.667 foot-ton THE NEW 14-180E, 45-CALIBER OUR NOW UNDERSOING THAT FOR THE NAVY.

which they fall-the average propulsive force being which they fall—the average propulative force being text a low processage of the maximum power epipted It is this average pressure that sends the shot on its destructive erand, and the alm of the ordnance engi-neer is to have this reasonably high while lowering the creat of the curve of maximum energy. The fart remedy tried was in the form of larger grids, be that, for a given weight of charge, the super-ficial area at eace expected to the flame depend by re-fused the contract of the flame area of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the con-tract of the contract of the contract of the contract of the con-tract of the contract of the contract of the contract of the con-tract of the contract of the contract of the contract of the con-tract of the contract of the contract of the contract of the con-tract of the contract of the con-tract of the contract of the cont

deals burned more slowly, and the propelling force was better distributed along the bore of the gun. This method led to the making of prismatic grains up to an tresh and a haif in diameter—regularly and care-bully formed. Next, a hole was bored through the

Besides this, a big percentage of the grain was blown out of the gun unconsumed Advance for a time was blocked until the powder makers evolved a "slowburning" propellant by changing the proportions of some of the ingredients. The purpose of sulphur is In lower the ignition temperature. The present is a second to the control information was momentarily retarded. By increasing the charcol a greater percentage of moisture was added, and that served as a slowing-up agent in the general combustion of the mixture. The powder that developed was called "not because of its color—the consequence of the underwork because of its color—the consequence of the underwork present in the color of the color of the underwork present in the color of t to lower the ignition temperature of the powder, and by lessening this element inflammation was momencharred charcoal used. In this country, we later called it "brown prismatic." The terms "quick" or "slow burning" are merely relative. In either case we are

Smokeless powder has quite reversed the task of the ordnance engineer. His aim now is to provide an explosive which can be made to suit the gun rather than plosive which can be made to suit the gun rather than to fashion the weapon to meet the violent vagaries of the older propellants. Our present smokeless powder generates a relatively low regular, and progressive pressure from the instant of ignition up to the time the shot leaves the muzzle of the gun with its maximum velocity. The curve of our big 12 inch rifles shows how much nearer the powder makers have come snows now much nearer the power makers have come to solving the problem, but mut hat pitent experiment-ing has yet to be done before the ideal is measurably approached

The operative cycle of a shot moving along the bore

of a gun is exactly opposite to that of a train or care gaining full speed from a standetill in the latter case, the engineer knows that he would endanger his cou the engineer knows that he would endanger his cou-plings—were if he did no other damage—if he opened wide the throttle at the instant of starting. So he be-gins by just acquiring headway and then gradually increases the motive energy until the train has reach definition of the second view of the second view of the speed—a matter of quite several minutes for a fast train and during a distance of a mile or two. The ordnance engineer, on the other hand, can give to his projectile only a fiying start by auddenly applying a great and violent pressure, and enough of this propulsive force must follow the shell to the mustic in order to give the desired maximum velocity. This in order to give the desired maximum velocity. This must be accomplished within a populo of not more than one-hundredth of a second of time and in our biggest guns, while the shot travels a distance of not more than fifty feet. A few figures will enable us to realize better the task set the ordnance engineer and

the part that amokoless powder plays in the resulting when measured by the power to strike an application. The shell leaves the mustle of one of our laisted 12 inch, 44-sallier riften, with a violety of 250 feet a second—13 62 miles a minute—and has a striking force at that instant equat to a blow of 62,632 foot tons. A feat express of 250 ions, thundering along at the rapid rate of 89.34 miles as hour in collision with a standing object, would be able to do at a blow of exactly corresponding magnitude. The quin's misalle within but \$10 pounds and the charge of peaker of exactly corresponding magnitude. The quin's misalle within but \$10 pounds and the charge of peaker mucholess propi land, and yet an wonderfully exquisited in the development of this simpendous energy lated for the development of this simpendous energy that the wayou is actually low is exact time the older 12-fuln rifle dealt with in the diagrams while the present-day gos has far more military value.

present-day gain has far more mintary value.

Referring to our diagram we see how far smokeless
powder has made it possible to improve upon the per-formance of the Armstrong gain of the "elighties".

That gain fired a shell of 820 pounds, used a charge of 130 pounds of black powder and gave to its shot a velocity of 1 400 feet a second the shot left the gun it had a striking energy of 10,980 foot tons. To-day our big 12 inch rifles weighing but forty-odd per cent more than the older weapon, can send their \$70-pound armor plercing shell on errand of destruction with an initial speed of nea 3 000 feet a second-delivering at the muscle a blow nearly five times as great as that of the Armstron gun The 'Mion gun with a powder charge searcely more than a third of that now used, developed the dangerous maximum pressure of 24 tons to the square inch in the powder chamber. Our big 'Wicklew"—using 'b6 pounds of smokeless powder—have a maximum chamber pressure in service of not more than 16 tons. This means a reduction of stress upon the breech of the weapon of quite 33 per cent and yet yielding an average propulsive pressure of something more than 60 per cent greater, all because the present powder burns slower and exerts its driving power for a longer period during the passage of the shell slong the bore of the rifle. It is the difference between the shock of a single, sudden, violent impulse and the better-sus tained push by which an object may be set in motion and accelerated

Burely these are truly autonishing strides, and yet so unobtrustively have they been made from year to year that but few of us have realized their extent and their significance in strengthening our powers of defense and of retalistion Such are the achievements of to-day! What may we not expect to-morrow?

(10 be continued)

A NEW MINTED STATES AVAL OUR OF CREAT POWER.

Our illustration of the new naval is that be un cannot fall to excite widespread interest among those who are following the trend of development in the United Ritates many. The piece was constructed at the Mid wide Works from plans of the Bursau of Ordnance, and received its finishing touches in the naval gun shops at Washington It is now undergoing tests at the Idahn Head Proving Ground which are giving much satisfaction to the officers of the Bursau

There seems to be a greeting conviction among aons of the leading naval powers that, in two of the feating naval powers that, in two of the feating naval powers that, in two of the fact their conganements will be fought at long ranges at which the remaining energy in reases greatly with an increase in the size of the gun future developed will be armed with a piece of larger calibrer than twice in clinic forcat British is building, if she has not already complicited, a 13½ lich kur, and our 14 inch piece has been designed and is now being teated, with a view to putting our navy in a position to arm future derendoughts entirely with the 14-lech the control of the control of

The telescope which is being installed in the Transvani Observitory will be the second largest in the British Empire It will be 75 feet long and have an apriume 26 inches in diameter. The Borkofelier Institute's Work on Infantii Faralysis,

The sayohle machinery in our body is made up of two systems—the corebre-spinal and the sympathetic, the latter does not here rearrers us. The exerbra-spinal system is made up of the brain, the spinal cord and the nerves, which are derived from the cord and strength of the health of the strength of the strength of the strength of the strength of the merces, composed of a cell body gray matter), and the deadfirsts or there while matter). The neurones composed of a cell body gray matter) and strength of the strength of the

The sensory ganglis in the spinal cord, to which sensations are telegraphed from the surface of the body, are in the posterior "horna", thence the sensations are transmitted to the brain cortes, from which in return commands are sent down through the motor ganglis, in the autorior horns of the spinal cord to the

muscles working the affected area.
Infantite partysis is known also to physicians as anterior pationy-sitis (spikes gray, specifs, marrow-aterm applied no doubt when the gray matter was erroncounty supposed to be marrow, and dis, inflammation is of the airctor horns in the spinal core—those parts of the airctor horns in the spinal core—those parts of the airctor horns in the spinal core—those parts of the control of the spinal core—those parts of the airctor horns in the spinal core—those parts of the control of the control of the control of the core of the core of sponsors of the part of the cored involved.

nervatied from the part of the cord involved inhantile partially is generally an acute disease, and by for the greatons sufferent rout, are titled and the partial in the pathon in the circumstance, we would infer tithough not, of course conclusively) the infections mature of this form of partysis. For aimost all the acute infections—measles, searlet fover, whooping cough, and the like—are penetrally disease of child hood, adults and the aged selfom contract them, if they have once contracted them in childhood, because they have not contracted them in childhood, because of the contracted them in childhood, because of the contracted them in childhood, because of the party of the contracted them in childhood, because of the party of the contracted them in childhood, because of the party of

In perhaps two-thirds of the cases that have been studed physic has have concluded them to be latetious, though they could not prove this, in the remaining one-third the disease has been attributed to falls, to anteredent matering fevers, and to homorhages into the spinal blood venues is not higher our present knowledge, however, it is safe to consider that such falls fevers and henorrhages have not been causative of the pallomyelitis but rather predispoing factors making the tissue concerned witner-

the street of th

coline. Singuish circulation, and impaired nutritions. Such as illuses begins undeathy with a high temperature and all the symptoms accompanying a fewer; there is a pain in the back and limbs; modelnly there supervious peralyzis, generally in the lag muscles. A child may be just to bed seemshary quite healthy, and may in the early morning manifest these sufferings. The outlook is ascentily good as to life idsaft, yet the everyity and retaility of the dissease, as in all infections, fluctuate violety; and catalage it all in all, pull-myellid is sufficiently disastronic to the extension of the community in the community of the community is morned larger questro.

ment antice, as it anothe give to consistency of special gives concern.

As infuncted, the infectious nature of pallonysitis has been rather assumed than proved; it would now seem that complete demonstration of infectivity will presently be forthopping. We may then extertain the confident hope of a preventive and immunising agent

against infantile paralysis akin to that which has practically eliminated smallpox from human experiments. But yil a 100 two German experiments real scalars and Popper, successfully inoculated two underly with the spain coreta taken from two fatth busans cases of pallomystiks. In both the membery fastions of the spinist order were on authory found stimular to the spinist order were on authory found stimular to

In September of 1969 Dr Simon Flatner and his colleague, Dr Paul A. Lewis, of the Rockothiele Institute, in New York city, obtained the cords of two children that had unfortunately ided of pallomyellits, in which cords the anterior horns established the characteristic gress and molroscopic appearances. Traismission was then made to monkeys. After either sathests incontaint was made in the brain of these similate through a small trephtee opening. The factor markerial consisted first of emulsions in satisfacts of the spinal cords of the mankery that had developed paralysis after injection of the first emulsies, that from the human cords. The spinal cords in series of monkeys thus incontained showed without exception lesions similar to those of human paleomyellits Now, a single successful loculation with human

Now, a single successful incutation with human virus resulting in experimental palionzyellits could not establish the scientific case here sot forth, because the result might have been due to a transferred text body, but in the experiments of Fenore and Lewis he transfer of the active agency of opidemic infantile paralysis was regularly successful. In one series of seven monkeys the first flocutation was of human virus, the other monkeys were successfully incutated virus, the other monkeys were successfully incutated virus, the other monkeys were successfully incutated to the producement, the disease requisitely resulting. Hence, by these and other equally conclusive experiments, one cannot doubt the infactions nature of palionywillia.

Again, later injections were made, not only in the brain of monkeys but also into the adominat cuts the blood vessels, into mere substance (as in the steatic) of these animals. Nor "one it yet be silled that still other avonues of infection (as the skin, the organs of respiration or the discertive truck) or ceits, for the entrance of the virus into the central nervous artsent.

controlled the second of the stress which is repossible for instantic paralysis. It is at present in visible under the microscope Flexner and Lewis after most chaustive search, have found that it is neither a hatterium nor a protoscon, which parasite have been looked as pathogenie of most of the infections diseases. The virus of infantic paralysis have been looked as pathogenie of most of the infection diseases. The virus of infantic paralysis analizor, it belongs to the oless of the minute and filterable viruses that have thus far not been demonarted with certainty. Neverbeless, although the smallpox virus still remains invisible to us, for a contury past a vaccion has been evolved from it by which we have practically benished this directful disease from the fare of the earth, there should then be no controlled the still representation of the conpagent against pallomyellits should not now in good time be forthcoming

By the way, did the reader note in this paper the phrase "fater either anosthesis" it means that the monkeys suffered no torture during these experiments, so beneficent in their trend for humankind. Let us congratulate ourselves that infantile paralysis is another added to the long list of dwasfur diseases for which a remedy is being found through animal zevolted. So, which could otherwise news have been reviewd.

An Riccire-passumatic Conveyor System for Libraries

# THE STRONGER AS A GLOCK. To the Editor of the SCIENTIFE AMERICAN

In regard to Mr. Baker's item in the January 1st number relating to the gyroscope not maintaining its position relative to the earth, but relative to a fixed point in space, if this be true, the gyroscope, operated by a small motor and set on a balanced pivot, would ake an excellent timepiece, although slightly different from those in present use, make only one revolution in 24 hours The clock would of course have to be set with the axis north and south, so the gyroscope would (apparently) rotate from west to east. It could also be geared so as to denote the minutes and soends, and would be absolutely accurate, with the ex-ception of the slight friction which would have the effect of slowing the clock a trifle

be made use of in maintaining the position of astro-nomical telescopes, if the vibration could be overcome, instead of the mechanical, clockwork devices now in

To anyone who has the inclination to experiment in this way, a timepiece of this character would make an interesting toy, and could be very cheaply con structed. An ordinary toy electric motor should serve the purpose of a gyroscope Edmonton, Alberta. CARL OFSTITUY

## WHY DOES A WATCH-SPRING BREAK!

WHY DOES A WATUR-SPARM PROPERTY To the Editor of the Scipatific American Why does a watch spring break after being in use quite a while? If not strong enough, why did it not

break at the very beginning? Such is the question propounded by the Editors of

Let us suppose a strip of iron to be fastened at one end, the other end boing free If we bend it a little and then let it go it will return to its place after viand teen let it go it will return to its place after vi-brating a certain length of time. It may do the same again and again, when we bend it more and more until finally after being bent beyond what is called the limit of clasticity, it will be permanently deformed Its molecules have then assumed a difficult nosition in regard to each other from that they had be

If we keep on bending it still more it will finally reak in two at the point where the strain is greatest or where a defect may exist

or where a detect may exist

Now let us try a good steel spring liere we find
no deformation appreciable When we bend it be
yond its strength, it snaps at once At least it appears to be so The probability is, however, that a permanent bending takes place first but at a point so near the breaking point that the difference escapes our observation entirely

ing to the other extreme we will take a strip of lead. There is then almost no clasticity, a very slight bending will deform the piece, but on the other hand, it will take a considerable amount of bending

So much for the immediate effects of bending or otherwise straining any given material. But now the question arises, what might be the effect of a strain not quite sufficient to produce an immediate deforma

tion, but applied during a long time?

I can give here an example that I have often the occasion to verify Take a piece of tin and a piece of zinc (in sheet) of the same size, bend them to so extent and fasten them. Two weeks later release them. The tin will return immediately to its former shape while the sinc will remain bent just as it was

Or take a piece of tar and put it on the table will keep its shape, and even stand quite a pressure without deformation or breaking down Nevertheless in the course of a few days its molecules will have yielded to such an extent that the piece of tar h even been able to stand its own weight, and has spread over the table

Now, what has taken place with the sinc or the tar dly occurs with the other materials within undoubtedly occurs with the other materials within octain lingit, at least it seems to me so. The place of iron kept bent near the point of immediate deforma-tion, must in a sufficient time yield and be detormed. The watch spring, or other steel spring, best best too quite shough to break must in course of time break up. The centimed tension of the molecules must have a tendency to displace them, and flushly causes them to yield

We have an immense amount of information as to the immediate deformation or breaking of materials of all kinds under stresses applied at once or during ort time, but only very little concerning the off a most kine, but only very little concerning the offices of prisens applied during a long time. Several expended to the control of the contro se a crystalline structure instead of the origi-

nal fibrous disposition

It is said that a watch spring is more liable to break during warm than during cold weather I am very much tempted to question the correctness of that opin However it may be so to some extent at least

in the first place, as a general rule the strength of all metals decreases with an increase of temperature Between the ordinary limits to which a watch is ex posed, the difference is insignificant. But it is not so as to the expansion of volume. The diameter of the tarrel changes but very little, but the spring, being very long, expands out of all proportion In fact the increase of kingth of the apring is about twenty five times the increase of size of the barrel

That is the equivalent of placing the spring in a smaller barrel and increasing its tension and liability of breakage in proportion Knoxville, Tenn

# SAFETY IN MINES. To the Editor of the SCHNTIFIC AMERICAN

In your issue of December 4th, 1909, in an editorial discussion of the Cherry mine disaster you state flames reached the dust-covered pine timbers of the structural work" This leads to a suggestion that the structural work in coal and other mines should not be made up of pine or other timber at all, but of from or steel Also, from another part of your discussion I conclude that ventilating shafts should be distinct the hoisting shafts.

In fact, the whole subject of protection to the miners should be studied out by scientific mining exp The duty to protect the workmen rests as moral on the owners and operators of the mines and this moral duty is in need of legal enforcement by appropriate statutes State and federal. The men are clearly entitled to protection, and protection would in the long run pay in dollars as well as lives

The whole subject of protection from preventable disasters—and most of them are preventable as is generally discovered after the event-needs to be made the subject of expert scientific study. The loss of life and limb due to accidents in mines, in railways and to burning factories theaters school houses and hotels is appallingly great, the more so when much of it, most of it, is clearly preventable. But right here it must be emphasized that too much reliance is had on nanical signal systems such as block signals on railways and the like. No mechanical system can ob-viate the need of supplementary personal human vigi-lance. There must be still the human watchman to supplement the mechanical system Mechanical sys-tems have their advantages—the advantages of autems have their advantage a-the advantages of su-tomatism But automatism newed the aid of buman intelligence and vigitance. There is too little value placed on human life the lives of workmen, of trav-elers of the apectators at the play, of the children in the great rowded shool bousse. The man who sees his loved once start on a journey is likely never to see them again, or at level (or word) their they alwe, it is not to be a summed to the play of the play, it is to be marked different at the play. It is to be maimed, disfigured cripples. Or the man him self may be stricken in his prime—the untimely vic tim of a lack of care or of undervaluation of human the pres dent of the railway system -as has happened more than once in the last decade—may himself become the victim of his own neglect and may ride to death in his palatial special

ne whole matter of accidents is in a condition un worthy of the intelligence of the country. For one thing, there is lack of constant inspection—eternal in thing, there is lack of constant inspection—eternal in spection, day and night There seems to be an unwar ranted confidence in wood, iron and steel, a gratui tous assumption that accidents are not likely to hap pen The proper wiser assumption is that they are sure to happen unless forestailed. They certainly do happen But somehow they do not seem to be taken into serious account. The plans for running railways, mines, and favories leave the vertainty of accidents so much out of consideration, as if they were mere "sports" of Nature, mere chances, whereas they are the certain and inevitable and hence preventable re-sults of well known factors—factors of wear and tear, factors of growing structural weakness in timbers and steel, factors of ever possible congruity of unfavorable circumstances, the incidental coming together of com-butble supports. bustible elements etc.

bustible elements etc.
In hotels it must be assumed that fires are likely
to happen at any or all times, and there is need of the
etcrnal vigilance of a sufficient number of trained brains to keep the whole area of danger under gent surveilance Mechanical appliances should not be regarded as a substitute for these living inspectors but merely aids. For the automatic system has a but merely aids. For the automate system has a county, unmechanical way of getting "out of far" at the worst possible time indeed it can be depended on to do this very thing. These observations apply to railways, mines, and factories it is not sufficient to have a jury determine whose negligence caused the posigiant or to say that it was due to some imperfection in the automatic signals Prevention is the thing Think what horrible deaths—deaths of scalding, burn-ing, crushing, maining—American men, women, chil-dren and babes are dying almost hourly The sick-ening scene is familiar—the 'unlooked for accident the sending for the nearest village or town surgeons, the "carting away," the "shoveling up" of the mangled remains, the horrible identification of charred remains by some jewel or scrap of a shoc or fragment of ap parel Prevention is the thing through expert sci ontific study and adequate impaction. The subject is of enough importance to warrant it being taken up in the great universities and technical schools, so that men could be trained by proper study and prac-tice to take charge of the important work of saving iffe by preventing accidents it would be a noble and useful work, if achieved—and it can be achieved and useful work, it achieved—and it can be serviced licitized so railways systems should have a depart ment with a trained corps of men to cope with these conditions out of which accidents arise. At its head a competent man, not to operate trains, but to remove the dangers of accidental death sure to arise when all are bent on running the trains on schedule (as now) and no one is thinking particularly of the human entrusted to the rallways system, these dangers would be greatly minimized if the right steps taken There is a railway west of the Mississippi River that has been operated for several decades, and tit enjoys this unenvisible distinction. The road has never caused a single human death 1 have heard also of a steamship line that has never lost a pass This shows what is possible If these con ger's life ditions were general how much happier overybody would be E L BLACKSHEAR, Fellow American Association for the Advancement of

An automobile chart has been invented by Mr Joseph J automobile chart has been invenied by air Joseph J Jones which nerves the functions of a unchanical sign post—Briefly the invention is a revolving card which tells the driver or any one in a car exactly where he happens to be upon a road An article on the German "Dreadhoughts" of the 'Nassau' type is published A Lettermoser distusses the present state of physical chemistry in colloids Dr G Hudson Makuen playstad chemistry in colloids Dr G Hudson Maximo writes on stammering and gives some suggestions as to modern methods of remedy at T contingiam strike on transformations and migrations of cels Most of us have probably never heard of Nicole Or come, yet he was the forerculeur of Copernius Prof Pierre Durham does credit to his work in an apprentiation and the continuation of the Parts tambels will be found in the Streyuway, an article case the continuation of the security consideration to the continuation. of peculiar interest in view of the recent inundation of the French (apital

The depth of the water in the middle of the Berlin-Stettil Canal will be I meters (984 feet), and the breath at the surface in ordinary soli 73 meters (19824 feet) In soft peaty ground it will be from 37 meters to 18 meters (1214 to 1246 feet) For a distance of 16 miles the bed and bonks of the canal will have to be puddled with clay, the surface of the canal there being above the water level of the surrounding country. At one point the canal crosses the valley of the river by an embankment provided with a culvert 160-meters in length eleven locks for the descent into the Oder are bogun One of them has a full of 9 meters (2952 feet) The question of building a lift besides the series of locks has not yet been decided. The 37 canal bridges are all to be built of steel

# CLEARING SNOW FROM RAILWAY TRACKS IN CANADA.

BY FRANK C. PERKINS.

The accompanying illustrations show the construc-tion and operation of a novel cylinder snow plow de-signed and constructed in the Province of Ontario when the plow of this remarkable machine is forced into a drift or cut, the snow is lifted by the abovel, which is inclined upward and meets the expeller chambers, the anow gliding along until it comes in contact with the expellers the blades of which revolve at a bigh speed in an upward direction Engaging the snow the blades throw it upward and outward at a great velocity, delivering it to a distance of 50 or 60 feet on each side of the plow and making a clear cut,

feet on each side of the plow and making a clear.

Il feet in which and at a speed of 6 to 8 miles hour in a cut 10 feet deep. The snow is elevated and thrown at so great a distance from the track the possibility of the smallest. quantity ever getting into the ent again is precluded. The snow does not enter the ex-petter chambers, and it is stated that the maximum velocity of the expeller blade at the periphery is 5 654 feet

the periphery is 5656 feet
The accompaning illustrations are front
and side views of this remarkable cylindor
snow plow I none view the snow expliers
are shown in operation, in another a cut 12
feet deep is illustrated The reader will
doubtless not the impression which wedge
and apron leave on the snow The thin end only 20 in hes shead of the exp

Other illustrations show the clusted track in a ten foot cut, and the machinery within the plow car, including the boller steam pipes and engine The expellers are directly nected with the engine shaft by means of two steel chain beits

It is stated that each of the stool ch belts driven by the steam engine of this is capable of driving the expellers at a moderate speed alone, so that should one belt be disabled the plow would still be able to work at a somewhat lower rate of speed The plow body is of steel construction th

the box portion having the sides covered with wood like a box car The roof is of similar construction. which is fire and water proof A door is provided on each side in the middle of the car, the back end being left open for convenience in stoking the boiler A lookout is built at the front end of the car from which

point the engineers can be signalled to The front end of the car, entirely of steel, has three chambers, the two side ones being circular, open at the front and one side, in which the expellers revolve These are nine feet in diameter and three feet six thehes wide Each expeller consists of a cast iron hub upon which are formed four spiral flanges, having a pitch of about fourteen feet Riveted to thes flanges are four half inch steel plates or blades twenty two inches wide comprising a true helix upon the hub. The expellers are mounted upon each end of the shaft and overhang the pedestals the shaft ex circular chambers. On the middle of the shaft, which is eight inches in diameter, is keyed the sprocket wheel, which is connected with a similar wheel on the shaft of the engine by the steel chains. Those four parts constitute the drive gen die chamber opens to the interior of the car On the front is constructed the ness of the plos, consisting of steel plates projecting forward to the end of the apron or shovel It may be stated that the apron or shovel is attached to the bottom framing, the side plates, the interior web plates, and the expeller cham-bers, by steel angles and plates. This apron extends forward five feet beyond the center of the expellers. The nose and shovel, being firmly riveted together, present a rigid construction to engage the snow.

This powerful cylindrical snow plow has singless specially constructed. The cylindress are sitted inches disnotes with eighteen inche stroke and work under a steam pressure of 150 pounds per square inch. the maximum speed being two hundred revolutions per unitude. They are capable of developing 750 II H. and are placed as near as possible to the expellers

The state of the s

to shorten the drive chain. The engines exhaust into the bottom of the smoke box of the boiler through a suitable nossie similar to locomotive practice, creating a strong blast.

Mr A. Kubelka of Bushowitz in Morairu has discovered a process by means of which the softest sand-stone or limestone can be made hard. The process is the following. First, the surface of the stone must thoroughly cleaned, so as to expose the pores. Any oil or grease spots must be removed with benzine or with the alcohol flame Missing pieces must be filled up with cement mortar, using a 1 7 solution of waterup with cement mortar, using a 1 7 solution or water-glass for temporing Affer the sions is thoroughly dry, it is saturated with a solution of petash or seda waterslass in case of rain during or immediately after this operation, the stone must be again cleaned, dried, and saturated with the solution. Then follows an impregnation with molten After this impregnation rain will do no more harm as on account of the reaction of the chloride of cal-cium upon the solution of waterglass, the pores of will be filled with insoluble, hard silice of lime, while the soluble allicate of lime will be de-composed and washed out by rain. Another method of Kubelka's is to saturate the stone first with a solution of sulphate of alumina, in water, and when dry

with a solution of potash waterglass. So ury to the repetition of this process will be necessary to thoroughly dill all the pores of the stone. It is esough if the stone is saturated to a dapth of about \$\overline{k}\$ into Milliah brank marks may be cleased either by rubbing with a piece of the same stone, or by reflecting the stone, or by resulting with sets branks. Should the solution not impregnate the stone quick second; it must be difficult with more waiter. The scription of the solution is much be directly with more waiter. The scription of the stone minute. Whatever he left over on the surface as the this time should be wind over you the surface as the this time should be wind over your window.

one minute. Whatever is left over on the surface after this time should be wiped wary with a rag, as the crystals formed by the evaporation of the water would make a rubbing and cleaning of the stone necessary. A separate brush should be need for each solution, so that the reaction should begin in the power of the stone. For larger surfaces atomisers or

sions. For larger surfaces atomisers or sprinklers may be used aucosatelly. Through these processes any soft lines actons or sendations may be made more compact and hard Their procusates and imperiousness will equal that of the hardest stone. After treatment they may be polished and cut The great advantages of the surface and the surface and the promisent quantities of the hardest atomisms. The product of the product of the hardest stone and the surface and the promisent qualities of the harder stones. harder stones.

Mortar and concrete may also be hardened and compacted by these processes, so that they may be used with greater success in works calling for water-tightness, as water orks, tanks, street pavements, sidewalks, artificial stone, cement blocks, etc

Monuments can also be protected by these processes from the influence of the weather

of Removing Hair f

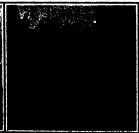

An article in the Ledertechnische Rund-schau mentions, without describing in de-tail, a new process for the rumoval of hair from hides, tail, a new process for the runoval of hair from hide pur jow with the segment commonly semployed for this pur pose (lime, sodium sulphide, etc.) are replaced by "suitable gas," which effects the runoval of the hair in from two to sight hours. The process is said to be sopically valuable for the preparation of colored latther and fine leather in general, as the product is and or very uniform grain and free from the spots which et very uniform grain and free from the apots which are often produced by lime and sodium sulphide. The leather is also much closer, tougher, stronger, and more floxible than leather made by the usual methods. Hides treated by the new account. more floxible than leather made by the usual methods. Hides treated by the new process may be tanned with bark, astract, or chrome alum. The inventor, whose address may be obtained from the journal quoted, will furnish detailed information to persons interested.

The Coming Accountle Show at Boston.

The first Accountic Show to be held in the United States without connection with any other exhibition, will open in Mechanics Building, Boston, Mass., on February 18th, and not on the 33rd, as announced in our last issue. This show will remain open one week, see enteen full-sized aeroplanes have already been sed, and the exhibition promises to be a represe tive one as far as the heavier-in-near machines are concerned The manager can be addressed at 5 Park Square, Boston, by any experimenters having machines

## THE REAVERS IN PERSONNY, 1919

IRST among the astronomical discoveries of 1910 is that of a brilliant comet reported from South Africa on the 17th of January

At that time it was but five degrees south of the sun, but it was so bright that it was visible in full daylight to the unaide eye, and observations of its spec-trum, made next day at the Lick

Observatory, showed the sodium lines bright on a continuous background- thus proving that the comet was very hot and self luminous.

This doubtless means that it was then very near

the sun, and strongly heated by its radiation

From the scanty information which is yet avail it appears that the comet is moving rapidly north. eastward and diminishing in brightness. has been computed and ephemeris will be found on page 123 of this issue. It is probable that it will be visible for a few weeks in the evening sky, just after sunset, and almost directly above the point where the sun disappears. It is, however, quite possible that it may

lose so much in bright ness, as it retreats from the sun that it will not be very conspicuous On the other hand it may be a fine object, and the eve-ning skies will be well worth watching especially about the leginning of February when moonlight no longer drowns out faint objects.

Halley's comet is still visible in the ovening sky and is very slowly increaswill probably be too faint for the naked eye, though porhana visible in a field

It will fortunately be casy to locate Just north of the planet Saturn are three stars of the fou magnitude, in an east and west line On February 5th the comet will be about 50 min of arc (or, roughly, one and a half times the moon's diameter) north of the middle one of these stars, and on the 17th it will be about the same distance north of the westernment of the three line of By following this line of motion it can

By the end of the month it will be pretty low in the west at sunset, and soon after it will ganish in the twilight, to reappear, much brighter, in the much brighter, in morning sky in April

While the appear these comets is exciting so much interest, a notable

the explanation of these phenomens. Observations of the spectra of the last two bright comets (Daniel's and chouses) showed that the light of the tail con et entirely of bright bands, given out by But at that time no gas was me lumin ous grus. some luminous gas. But at that time no gas was known which gave just these bands. Very recently Mr Fowler of South Kensington, England, has found that a vacuum tube, centaining small quantities of nitrogen, and of carbon compounds (excited electrically so as to glow), shows a spectrum exactly like that of the comet's talls, provided the pressure of the gas is made exceedingly small

As the pressure and density of the gas to a come's tail must be almost incalculably less than in any vacuum which we can produce by mechanical means, this gives us a satisfactor explanation of the observa-tions. The luminous particles though so thinly distributed through space, are molecules of familian gases, and one of the mysteries which surround comets has been cleared away

#### MRTHOD OF ECONOMISING GAS. NY A J JARNAN

How to economise the consumption of gas for illumitating and heating purposes in a question of consider able importance to-day. The price charged for coal gas

at the present time many towns and cities is so high as to prevent its use for cooling pur poses. Only b exercis-ing the utmost econ ing the utmost econ omy in using only just enough to rook the small quantity of food required does the use of gas for cooking become advantageous under such conditions.

SECTION OF THE SAS MIZING APPARATUS

By means of a simple apparatus the heating qualities of the gas can be improved so as to reduce cooking ex penses and the cost of lighting as well, for in Welsbach and kindred

lamps it is the heat of the burning gas that renders the mantle brilliantly incandescent Moreover the the mantie brilliantly incandescent Moreover the lighting qualities of the gas are greatly improved as well. The following apparatus, which was first made by the writer in 1872, has been put to the test in hundreds of cases and has proved its efficiency in every instance. Any man who is handy in the use of metal working tools can make one and fit it to suit his gas supply by attaching it to the supply pipe after the gas has passed the meter, the gas then belongs

the gas has passed the meter, the gas then belongs to the consumer, it being the property of the gas company before it passes the mater. The apparatus here described is suitable for a ten light meter, with all the fittings for lighting, heating and coaking it consists of a closed the cylinder A six inches in diameter and seven inches high without he control to Whitn this vessel is placed another cylinder made of gaivantsed wire netting, with a half-light high property of the control to the contro inch mesh the diameter being four in hes and height seven inches This wire cylinder is placed within the tin case, having a one-inch space all round Within pace clean, white cotton waste is packed. A tin ler C six and a half inches long and three and cylinder C six and a hair in these long and three and non-hair linches dismoster is soldered all round to the cone top of the cylinder A and is provided with a perfect of the cylinder A and is provided with a perfect of the cylinder A and is soldered by the cylinder and the saturates the rection waste D. The cylinder C at the saturates the rection waste D. The cylinder C at the approach C and the cylinder C at the approach C and C and C are the cylinder and then passe out through plue F. The apparatus is charged with besults, greatened, or a similar valuatile hydrocarbon core as follows: benaine, graodine, or a similar volatile hydrocarbon capable of being taken up by the nonliluminating constituents of coal gas, such as hydrogen, marsh gas or carbonic oxide At G is a suitable braza stop-cock which canables one to turn off the gas when charging

A 100-LIBER AND A SALISHY GAS BOOKSWIKER

the apparatus with gaseline. The brass cap at B must have a filth of plishle bastlers fitted in the interior so that it becomes periodicy gate-light value across down. It is necessary to make a hole in the supply ripe B at B so that it case the gaseline should cover the bettem of the inity type this would prevent say fishering of the light B to babiling of the sus through the light B.

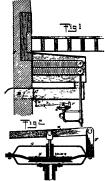

The charging of the apparatus must be carried out in daylight, and it should be fitted near a window where daylight is admitted, for a lighted match, candle or lamp must not be used With these simple precau-tions the apparatus is perfectly safe. The cone top or lamp must not be used. With these simple pressus times the apparatus is parfectly selected where the tim criticol must be perfectly soldered where the tim criticol mest, and all the brane connections attached to the inlet and outlet pipes must also be perfectly soldered inflar nulsber piping or consectives must not be used soldered connections, must be used. When the economittee is fitted and charged with about three pints of gasoline it will be found that the intensity of light from an It will be found that the intensity of light from an ordinary naked burner will be vastly improved
It has been found that half a gallon of benxine will

take the place of 500 cubic feet for direct illumination in this apparatus

The cotton waste in the economizer must be nacked The cotton waste in the economistr must be packed moderately light. If packed too loose it will sink and give less surface for the gas to reach the gasoline. Bo sure and mark the outer end of the inlet pipe IN This will prevent any mistake when installing the

## REGULATOR FOR INDIRECT AND DIRECT-INDIRECT STRAW HEATING NY 8 4 30

Every indirect and direct indirect steam heater ld have some kind of a regulator so as to shut off the air supply when there is no heat in the radiator, otherwise, especially at night when the steam pressure goes down and the air box remains open with the

REGULATOR FOR INDIRECT STEAM MEATING

cold wind blowing directly into it, it will soon rool off

The accompanying illustrations show a very simple way to make such a regulator Fig 1 shows the gen eral arrangement of an indirect heating radiator, and ig 2 shows in detail the regulator

The radiator A is inclosed in a box in the usual way The radiator A is inclosed in a box in the usual way king its air from the outside torough the passance B and having a shutter or damper C mounted to turn in unliable bearings on a shaft. The latter has a small bell crank D secured to its outer and which through a link is connected to a lever B. The lever B is pivoted in suitable brackets P fastened to the regulator Or be regulator on the major of two small frying pass ets say about 6 inches in diameter. A part of the conical rim is bent outward forming flanges for boiling the same together. The bending is done very easily. Place the skillet over the edge of an iron block, and with a flat peen hammer stretch the edge, say and with a flat peen hammer affector fine dogs, say about \$\frac{1}{2}\$ inch all around To the lower head, rivet a small floor flange, which will serve for connection with the steamplip from the boiler. In the center of the upper head a hole is made large enough to re-ceive a half inch nipple. To the lever is featened a short not which passes down through this nipple to the disphrarm H

the displayment H
The displayment is made of sheet rubber, say 3/16
tanh thick with one or more layers of duck in it. The
top and bottom disks of iron with bereided adder
about it, inch thick are riveted. To the upper disk is
soldered a half inch implies or player of play, service
as graded to the service of the service of the
top of the service of the service of the service of the
The whole is now placed between the two
The the lower hand is formated the service of the service of

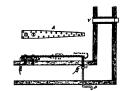

To the lower head is fastened the usual siphon pip te prevent the steam from othering the regulator A the steam pressure rises it will force the disphragm upward, thereby opening the shutter  $\sigma$  in the air passage B, permitting the cold air to pass under and through the bank of radiators, thereby heating them thence up through the register into the room and will keep it open until the steam pressure goes down. The weight of the arm E will then close the shutter per mitting no more air to pass until again opened by the steam pressure. A weight may be attached to this lever, so as to close the shutter more effectually

## THERMOSTATIC ALARM FOR HOUSE REATERS

The accompanying diagram shows how a simple arm for house heaters can be made.

The object of this alarm is to give warning when

the furnace is overheated and needs attention, or when the fire is nearly out and needs more coal. A there static bar A 11/2 inches by 1/16-inch is made

THERMOSTATIC ALARM FOR HOUSE HEATERS

and from riveted together very closely and fastened at one end are brackets B which are secured to a suitable base B. The free end of the bar A moves between two contact points D made of ordinary acreways. These are screwed into posts C made of ½ inch dowel

and secure d to the base H

The whole is fastened in an inverted position over
the furnace or other place where there is danger of over heating After the contact points are adjusted to close the circuit at the proper temperature they are con nected up to an electric bell and battery as indicated in the drawing

A switch is placed in the circuit at some convenient A switch is placed in the circuit at some convenient point. It will now be seen that when the thermostatic bar B moves to either aide according to the tempera-ture and makes connections with contact points D the bell E will ring. When the apparatus gives the neces-sary alarm, the switch must be turned off until the trouble is remedied

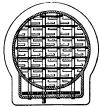

ADAPTING A GRATE FOR SHALL COAL.

BY J. A DEBUSTRON

The grates in the ordinary bouse heating furnaces

are regulated and made for the best and most suitable
size of coal to be used in each particular case. That is to say in a large hot-air furnace where egg coal is most suitable, a very coarse and open grate is pro-vided but in a smaller furnace where smaller coal is e used, a much closer grate is furnished

In some localities where pea coal is much cheaper than egg stove or nut it would perhaps be more eco-nomical to burn the pea coal provided the grate would permit As a rule, if the pts coal is used in these large furnaces it has not proved very successful on account of the coarse grate, unless a new one is put in more suitable for the smaller coal as the shaking of

STATE ADAPTED FOR BURNING SMALL COAL

the old grate will cause the whole fire to dump into the

To overcome this the writer has tried several meth

of and has come to the conclusion that the best is that shown in the accompanying illustration. The grate is an ordinary rocking floger grate. Between every or every other floger (which will die pad upon the kind of grate and also of the size of coal to

be used) is placed across the entire grate a piece of say ½ inch pipe or bar. These pipes or bars rest on the grate bars and are not affected by the rocking of the grate. As the sames acroundate on top of these bars they have a tendency to keep them in place and will prevent them from moving or burning

There should always be a layer of an inch or two of sahes on any grate. Care should be taken not to shake the grate too much, as a great deal of live coal will fall through and sometimes start to burn in the

shake the grate too much, as a great deal or tive coat will fail through and sometimes start to burn in the sah pit thereby warping and destroying the grate bars. The writer has used some old pipes and grate bars for a number of years and to-day they are as good as Some years ago, during the coal famine, a great deal of bituminous coal was burned with perfect success It is best when starting a new fire to clean out the ash pit and if any live coals fall through they may be showled up on the fire sgata until enough ashes are formed to prevent them from falling through

## HOW TO BURN COAL ECONOMICALLY

The accompanying illustrations show how in a very simple way the gases in an ordinary furnace may be simple way the gases in an ordinary furnace may be consumed and burned thereby giving off a more uni-form heat and maintaining an even temperature throughout the house continuously night and day It will effect a saving on the coal bis and produce more

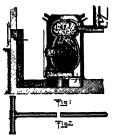

The fire in a stove or furnace is simply the result of a chemical union of the carbon properties of the fuel both solid and gaseous, with the oxygen of the alr

By the complete combustion of one pound of coal 14,600 heat units are given off, but by the incomplete combustion of one pound of coal, as burned in the great majority of domestic heaters, only about 4,000 to 5,000 heat units are produced and the balance of the heat passes away up the chimney a rich combustible gas that should have burned

tain the highest efficiency from coal it must be burned with the least possible supply of air con sistent with perfect combustion, as an excess of air carries the heat of the fuel into the chimney and a carries the neat of the the linto the chimney and a certain influture of air from below the grate will cause an explosion in the smoke pipe blowing the fire door open and filling the cellar with spint gases Nearly every furnace discharges see alled "coal gas

which is due either to poor draft or a defective fur nace, or an improper adjustment of the dampers. As the odor is so noticeable, the difficulty is soon reme died Every furnace however, is constantly discharg ing more or less carbon monoxide gas which is per fectly odorless and is a very energetic poison, as the of Imperfect combustion

Ordinarily the domestic user of coal roasts out the gas, opens the dampers and drives it up the chimney and then proceeds to burn the coke, which is only shout one-half of the heat value of the coal, besides it is not alone the heat that escapes up the chimney, but the rich combustible gas that passes away uncon sumed. This gas when burned produces a uniformly

ARRANGEMENT FOR BURNING THE GAMES OF THE

higher temperature than the coal lizelf, which may burn at varying temperatures even so low as to pro-

dues but little heat

The clinkers that form in the furnace are the result of an excessive draft below the grate

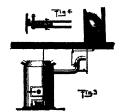

To accomplish the mixing of the hot gases and air

the air must be heated to the same temperature.

The most common domestic heating furnace is the bot-air furnace. This is simply an improved stove in-closed in a sheet iron or brick casing. The furnace cats the air within this inclosure to a, high tempera

tin pipes. To keep this current of hot air rising, a with the outside air and is regulated with a damper This cold-air box should always be kept open as much as possible and never entirely closed while there is the furnace, as the furnace will beco heated and may be injured.

Fig 1 shows how the common hot-air furnace may be adapted to burn the gas of the coal A small pipe, be anapted to ourn the gas or ins cost a same pur-may I inch or 1½ inch is inserted through the upper part of the smoke pipe (as the gases here are the hot-test), terminating in close proximity to the smoke collar just inside of the radiator of the store. inner end may be fitted with a suitable spreader, such as shown in detail in Fig 3 The cross pipes have a number of 3/16-inch holes drilled in the lower side, or

HAND METHOD OF PROSTATING THE DAMPERS

facing downward. The outer end of the pipe is fitte with some kind of a damper to regulate the supply of air. As the cold air passes through this pipe it be-comes heated and at its delivery end is of the same temperature as the games, but as the specific gravity of this beated air is much greater than that of the gases in the furnace, it drops down and mixes with the gases forming a combustible mixture which now burns with a blue fame, just as in an ordinary gas stove if a small place of mica is inserted into the fire door this burning may be observed. It is a very

iteresting phonomenon In order to make the system a success the fire pot must be in perfect condition, that is to say, in a hot air furnace there should be no communication betw air furnace there should be no communication between the fire pot and the air chamber, no cracks and no loose joints. The fire door should be as air-tight as possible. This may be made tight in the following manner. First, file and remove all rout at the edge of the door until a motalitic surface suppears, then out a harrow strip of ascession and seak in salt water, after with place it around the door and it will ashere. Put a litie oil on the door frame and close the door The asbestos will then fill up any opening and bake very hard on the door

hard on the door if everything below the grain were absolutely atritich to combustion would take place, but as all formaces leak more or less this leakage is enough to support combustion in ordinary weather in extremely cold weather, however, the alide in the sab pit door may be opened a little, so as to furnish a little more air

A damper is attached to the smoke pipe above the air pipe, so that when open it will not cool off the air

A fire is built in the furnace the ordinary way, keep the air damper closed until a good fire is obtained, then put on some coal and keep the lower damper open for a few minutes, after which close all drafts and open the air damper, regulate the same according to the heat required, that is to say, more heat, more air Through the before-mentioned mica window ob-serve the results. All the gases in the furnace will, however, not burn, as some are bound to escape un however, not burn, as son

There is more economy in running a large, slow fire all day long than a hot one at intervals. There fore it is best to coal the fire twice a day, in the morn ing and at night, and regulate it so that the fire burns with an even temperature. It will keep the house at a

with an oven temperature. It will keep the house at a uniform temperature slight and day.
When the furnace has been cooled for the day of the night the dampers may be controlled from any room above by simply relating or lowering a lever con-nected with vehice ranking over pulleys to the various dampers, thereby saving many a step. This is above in Fig. 2, a sectional plan of the levers is shown in Fig. 2, a sectional plan of the levers is shown in

Fig 4
In ordinary weather the fire should only be shaken
the morning, but in very once a day, preferably in the movining, but in very mild weather twice a week will suffice. Only shake until the first red coal comes down. In furnaces with very strong drafts shake but very little, as the layer of ashes on top of the grate will help check the draft. If the first is very low stick a law pieces of kinding wood into the fire. This will heat up the smalle the The ambuit door may also be opened until the fire drawn up, then regulate as before described.

With this arrangement in good working or rticle of coal will burn to an ash. al, of course, will not burn.

This applies to all three heating sys unus appues to au three neating systems in equipalities, namely, hot air, hot water, and steam, as it only takes care of the fire.

In hot-air heating, in addition to regulating the fire

In hotair heating, in addition to regularing the my the cold-air box must be regulated. This box generally by terminates outside the building under a porch. If has always been a source of annoyance because of changes in the direction of the wind. Sometimes the changes in the direction of the wine. Sometimes use wind will blow directly into it and cool off the house, but when the wind is in another direction it will such the hot air out from the furnace info the atmosphers To overcome this a shield is placed in front of the box, say 8 inches from the building, overlapping about 12 to 18 inches all around Then it will be impossible for the wind to interfere with the regulation of the six, which is generally done in the cellar with a damper or shutter

or shuter

The pipes in the cellar leading to the regis
ahould be kept clean, also the registers Avoid
ting any wire netting to catch articles dropped ther
as it will catch more dirt than anything else, so d put

as it will catch more dirt tan anything eise, some-times clogging up the meshes completely, forming an excellent breeding place for bacteria.

The water pan should be connected with the water supply, controlled by a fixet valve. This insures an even water level in the furnace

even water level in the rurance.

In steam heating plants the boller and radiators should be large enough to keep the house at a temperature of 70 deg in zero weather with one pound of steam, as this will take a great deal less coal than when the boiler and radiators are too small, and require a steam pressure of 10 to 20 pounds

In houses where the draft is good one day and poor the next, despite favorable winds, the fault is with the chimney It should be built higher This is a great deal cheaper and better than to put an unsightly cap on it

#### HOME-WADE ASK SIFTED BY J A BROPWY

A dustless at hifter can be made at a very small expenditure of money by following the lines of the secondarying driving Make a box A shaped as above a comparing driving Make a box A shaped as above 1 to love the property of the secondary of th

Then make a frame C of 1 inch wide stock, 1 is narrower than the inside width of box and 1 inch shorter than the inside length of the box Bore a 2-inch hole in the center of one end of this frame and cover the frame with \( \frac{1}{2} \)-inth mosh galvanised netting. Inclose three sides of this frame with thin board about 5 inches high, tapering the two aides, as shown.

SECTIONAL VIEW OF THE WOMENAND ARM STOPES.

and leaving the discharge and open, which should be and leaving the discharge and open, which should be hinged to frost end of box with two if by S-inch hinges. Put a piece of rope through a hole in the upper end of rame and fasten it not up so that it will not pull out. The box is now ready for the top which has a hinged door D, as shown. On tips of box places a palley and run the rope through the hole in the top of the box

run the rope through the hole in the top of the best and over the pulley wheel. The seed of this rope have a large ring stacehol to it as shawn. This arrangement will allow the sifting frame to be swung up and down, jarring the fruits every time it strikes the block? I fustened to run of the box. Over the opening in frent of the form.

Over the opining in frent of box faston a bapeleaped collect to gridle the dishiper to a notable recognised and

cloth to guide the consparer so to prevent dust from rising.

pictibling and wheatric trubbs. So far they
have fulled to develop any serious difficultion. It took the utmost patience on the

larm hilds to sevent may serious although the time, it that the utmost patience dit the part of Mr. Beison to develop the being to a state which he now considers practically "non-proof." Nationally being the state of the state of the state of the problem as not been so patient and has represented by the state of the all superfluous weight be eliminated. The question of weight is not so vital a mat question of weight is not so vital a mat-ter in the ordinary street car and has never received a great deal of attention. Mr Raight A. Beach, who has been Mr Edison's assistant in adapting the storage battery to traction, was called upon to build a special car that would be as light as possible. He found that the common street car is marely a small car at the care that the street car is merely a smaller and alightly modified steam railroad car, and it was modified attemn realities cas, and it was necessary for him to branch out on en-tirely new lines. He guarded as jealously against unnecessary weight as the builder of an aeroplane. The backbone of the car of an aeropiane The backbone of the car-he wolved consists of two 18-foot lattice girders which extand the entire length of the body under the ser's They consist of electrically welded steel bars and are so inficialise that when loaded with two tons at the center they show a defection of the 18-foot of t of but 3/1000 of an inch Around these two girders the car is built. In the first place they form a cash built in the first place they form a cashing to receive the batteries of which there are 210 cells, 100-on each side for power and 10 for light-ing All the superstructure of the car is built of veneer and light woodwork with the exception of the strap rails and posts, which are of bicycle tubing and act as a framework to support the weight of the roof. The roof itself consists of a single sheet of veneer bent to the preper form, and is so light as to pe form, and is so light as to permit of making the side poets much smaller than in the ordinary car. The fact that this car does not have to support a trolley pole has allowed of using so light a roof.

The truck contains many novel feat-ires. The connection between the truck and body is such as to permit of a side and end movement of but 1/4 of an inch. although it may move vertically to a although it may move vertically to a much greater degree The object of this is to insure smooth running and to pre-vent the usual swaying. In place of the usual car wheels light steel wheels are used. The axles are divided at the centur, being connected by long sleeves which permit one wheel to gain upon its mate when rounding curves or in case of a slight difference in their diameter. In this arrangement will be seen the influ-ence of the automobile. There are other features as well which remind one of the automobile and show a radical departure from the common car construc-

tion in place of genting the motors directly to the wheels a silent chain drive directly to the wheels a silent chain drive is used which, as automobile practice has shown, furnishes a more comomical trans-mission owing to the fact that a large part of the sprocket wheels is in mesh part of the sprocket wheels is In meals with the chair, whereas in the spur gaar transmission only one tooth, or at most, three teeth of the pinde, oit, all sunges the teeth of the gear. Furthermore the chair drive parmits of a greater for a reduction. Commonty a 2 to 1 reduction is the most used on railway cars, whereas on the storage battery our a reduction of the form of the storage battery our a reduction of the latest the storage battery our, a reduction of it is employed. This permits of stding lighter motors, and hence forms one of the batter state. I confirm the control of the control

The car is to be toated on West Street, in this city, where an excellent opportunity will be given it to demonstrate its efficiency for You will be interested gards the battery, but the light car contruction as well

> ARTIFICIAL PRODUCTION OF THE VOICE. (Concluded from page 120) emitted by the laryux were recorded by a

phonograph The following conclusion were reached When the larynx of a dog is remove during chloroform ansethesia, the lar yngeal muscles retain their ability to con tract for a short period, which varies from 3 to 10 minutes, but no contraction can be produced in the muscles of a dead even if it is removed immediately the arterial blood has escaped in order to arterial blood has escaped. In order to produce the vibrations the current of air should be impalled by a pressure of from 6 to 8 inches of water as it is to be pressured. is in the normal production of the bu In these conditions the excised larynx of the dog barks and howls in every note of the canina register from the deep baying of a mastiff to the shrill pipe of a terrier These various notes pipe of a terrier These various notes are obtained at will by causing various muscles to contract if the stimulation is confined to the muscles which connect the two arytenoid cartilages (two small cartilages at the back of the larynx to which the posterior ends of the vocal cords are attached) these cartilages approach each other and a deep tone is produced if on the other hand, the stimulation is extended to the muscles which connect the arytenoid cartilage, with the thyroid cartilage (the large V shaped cartilage at the front of the lar ynx, constituting the 'Adam's apple,' to which the anterior ends of the vocal cords are attached) the vocal cords are contracted and a high, shrill note re

dependent of the pressure of the air and the strength of the electric current, and to be determined solely by the part of the muscular system of the larynx to which the stimulation is applied. The whole larynz, including the glotts and the epiglottia, changes its form with every change in pitch. Hence the larynx various notes by changing its form and

These (xperiments, in addition to their scientific interest, explain the purely scientific interest, explain the sudden loss of voice to which singers and public speakers are often subject. The loss of voice has nothing to do with the vocal cords, but is caused by a sudden contraction of some of the muscles which ontrol the glottle and is analogous the rheumatic and neuralsic pains which body

# BERNARD PALISSY, THE PAROUS PRESCH POTTER, AND HIS WORKS (Continued from page 125) etc., that modern scientific re

search has proved to be correct. He was arrested as a horotic in 1588 and im mured in the Bastile, but in 1590, before

Nis case had been disposed of, he died Quite a number of authentic specimens of his work are in existence, and they of his work are in existence, and they are practically as priceless in value as they are superb in execution. At the Louvre and Cluny Museums, from which our illustrations are obtained, (Concluded on page 185.)

Tookclades from sage 135.)
he is very completely appreciable
hy theorism specimens showing the
three distinct styles that he adopted
in the course of the delephorment of his
art. His first dishes were usually oval
is folks, decorated in the center and at
the edges with animals, modeled after The edges with animals, modeled atterdered to the edges with animals, modeled atterdered to the edges of the very important and sometimes he repro d, in poly-chrome pottery, the paw ter vessels of the then celebrated Briot, such as the famous piece which repre-sents the "triumph of temperance," of h an illustration is here pres and he modeled in miniature sculpture and afterward colored and enameled a very diversified series of small articles, e, hurdy-gurdy and bagpipe players

We produce herewith a portrait of Box pard Palisay from an old French mini-ature of his period on veilum, that is preserved at the Cluny Museum Palisay ed at the Cluny Museum oreserved at the Chuny Museum Palisay is represented, full face and in court cos-tume with ruffs. His doublet is embroid-ered and relieved with gold, the sleeves are be-ribboned, and on the chest is braid Above the head appears the inscription B. Paliesy

His works reflect alike genius and artistic taste, and his work was original, marvelously true to nature in execution and coloring, and probably in a more marked degree than any other master of the ceramic art, he learned to perfect colors that would be, after firing known quantities, a knowledge that enabled him to duplicate, with such wonderful certainty, the color effects of the fish, rep tiles, insects, etc., he loved to reproduce The extent to which his style was imi ated affords the most practical proof of the favor it enjoyed

# Hartford Fire Insurance

With the coming of 1910. THE HARTFORD FIRE INSURANCE COMPANY has rounded out a century of busness history That means something in the hazardous business of fire insurance, for four out of every five companies organized in this country have either failed or returned. It means unshaken stability country have either latted or return I means unstaken stability.

The smoke of every great American conflagration has darkened the sky over the Hartford's head. In San Francisco alone it paid ten millions.

But emerging triumphant from the ordeals of 100 years, it enters its second century stronger than ever

Unshaken stability for a century is no mean hentage, but age is venerable only when adorned with honor than honesty it is the quality which impels an institution to meet than nonesty it is the quanty which impels an institution to meet every obligation, not only with promptness and exactness, but with fairness and a spirit of equity. That is the Hartford's record in the past, its aim today, and its ideal for the future. Its policies afford pass, in a said today, and and by co-operating with its patrons to lessen fire dangers, it offers continuous service. Its busness, scattered among more than 15,000 communities throughout this great land, is the largest of any fire insurance company in America. Its ageits are everywhere.

## A POPULAR ILLUSTRATED WEEKLY OF THE WORLD'S PROGRESS

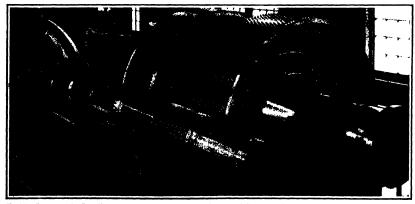

Vol. CII.-No. 7

NEW YORK, FEBRUARY 12, 1910

10 CPYFX A COPT

The upper cograving shows the space occupied by the boliers and engines of the "Mauretania." The two lower engravings demonstrate the large saving in space resulting from the use of high-speed tarbines, driving, through reduction gears, three sistemapeed projections. They would never 1,460 tones of coal and ore of \$5.00 on each translitantic trip

The pinion, direct-connected to the turbine, runs at 1,500 revolutions per minute. The spar wheel, direct-connected to the propeller, runs at 200 revolutions per minute.

SPEED-REDUCTION GRAE—A WAY OUT OF THE MARINE TURBINE DILBERTA—[See page 142.]

### CANADA AND THE QUEBEC BRIDGE.

MHNERING and architectural works of tifirst magnitude are to no little degree an expression in concrete form of the character of the people by whom they are built it would be difficult to define the extent to which our impressions of the audient Greek are based upon the architecture of his noble shrines and temples or how far our respect for the later Roman is due to feats of engineering skill that would do credit to our twen tieth century civilization

Because of the skill and daring which are or seem to be involved the design and erection of bridges of numeral magnitude has ever been considered one of the most difficult, we had almost said spectacular feats of construction and the successful such structures has brought world wide fame to the in which the work was done. Thus the Forth Bridge In which the work was don. Thus the Forth Bridge stands te-day as one of the noblest menuments of con-structive engineering in the whole of the British em-pire, and a memorial to the man who was responsible for the design has recently been placed in Westmin ther Abbey So too our own beautiful and dignified Brooklyn Bridge over the East River is a lasting tribute to bridge engineering as individualized in America and the city of Trenton has recently un veiled a monument to the memory of Roebling the

velied a monument to the memory of recently the father of long span asspan used method brings interna-tional fame to the man and the people who earry great engineering works to a successful issue must, in the very nature of things throw a proportionate shadow of discredit when one of these great struc-tures falls in utter ruin and, as in the case of the quebe Bridge (arries night upon en hundred souls to destruction. This fact was frankly recognized at the time by the cogine-cing and to bink all press both in this country and in Canada, and it was realized to be a matter of national importance that when the to be a matter of national importance that when the bridge came to be rebuilt, the new structure should not only be perfectly stiff and strong but that it should embody such architectural treatment as would render it esthetically pleasing to the eye, and worthy of that great school of bridge engineering which has sprung up and flourished in the Western Hemisphere

When the Canadian government took hold of the matter and lent all its powerful prestige and financial assistance to the scheme, it was accepted as an augury that the new bridge would be worthy of the great Dominion across the border line. We have to confess Dominion across the norder inc. we have to convex flow ver that the bridge which it is now proposed to build is decidedly disappointing. The type selected and the method of treatment are not up to the latest standards of bridge engineering in other words the design is distinctly commonplace. Æsthetically it

bas not a single redeeming feature
In redesigning the bridge, the Canadian go could have made more sure of securing the hest pos-sible designs, if they had thrown the bridge open to world-wide competition. We should then have learned whether the strongest, most economical and most beautiful bridge could have been secured under the cantilever or under the suspension system of design Personally we believe that on all three counts it would be possible to produce a suspension bridge the would be greatly superior to the structure which it is ros proposed to build. The suspension bridge espe-cially when built of these great proportions is a far-asic bridge to creet not being subjected to those beavy erection stresses which are the peril of large heave erection accesses which are the peril of large cantilever secretion. Moreaver the essential elements namely the authorages the towers and the main cables are at all times entirely free from suspicion, and may be erected with the absolute certainty that they are well within the limits of safe construction. With these main elements assured, it is possible for failures to occur in subordinate elements, such as the suspenders and stiffening trusses, without in the least

endangering the integrity of the bridge as a whold.

Not so, however, the cantilever bridge, the gree part of whose intricate framework is in compr Let but one among the multitudinous members of the main trusses fail, and the whole structure will be thrown into immediate and absolute ruin—as witness the mass of tangled steel now lying in the St Law

rence River For the credit of the profession of bridge engineer-ing in the New World, for the prestige of the great and growing people of Canada, and above all for the creater asfety of the public at large, we trust that, before the final plans of this great bridge are adopted the Canadian government will take stens to make it certain that the final bridge will, from every point view-ongineering, architectural, and artistic blest work of its kind yet erected in any country

#### CAUSES OF THE PARIS FLOOD

HERE appears to be a consensus of opinion among the French scientists that the causes of the recent phenomenal rise of the Seine when it reached the record height of 31 feet 2 inches, are to be found more in geological than in meteorological conditions. The basin of the Seine and the strams that are tributary to that river consists of a light absorbent soil, and, as the slopes are gentle any sudden precipitation is ordinarily absorbed by the ground. In winter when the soil is either frozen or enturated by the rains, there is a risk that the run-off of a heavy precipitation will be so large and sudder as to overtax the capacity of the river channels. These conditions obtained to a marked degree during the reeent continuous heavy rainfall and flood coologist is of the opinion that the heavy rains preceding the flood found the soil of the Seine water thoroughly impermeable because of saturation that the water ran off as swiftly as it would from the surfa of an asphalted or comented street Furthermore, seems to be generally agreed that the denudation of the ferests in the higher regions of the watershed has been a contributory cause to the flood. Not only do the trees assist evaporation but the forest undergrowth also nssist evaporation but the forest undergrowth also exorts a material influence in retarding the flow of

Referring again to the question of the prevention of future fluxes at Paris regarding which we made editorial comment last week, there is an siternative plan to that of dredging or widening the channel and the removal of river piers which, were it not for the enormous expense involved would afford an absolute safeguard against future disaster. We refer to the beroic measures employed by the Austrian engineers vent the floading of the city of Vienna by the Danube This consisted in cutting an artificial channel entirely around the city through which, after the river reaches a certain elevation all the surplus waters are diverted and discharged into the river below the city. It would be possible to create a sim that by pass around the city of Paris, but the cost due the great value of the land which would have to condemned would probably be found to be prohibitive

### WATER COMMERCATION IN NEW YORK STATE

FFER about three years of investigation of the subject of water resources, the State Water Supply Commission estimates that i 500,000 horse power of water energy is run-ning to waste every year in the State of New York and that if this were developed according to plans drawn up by its ougineers the State would realize a venrly rental of at least \$15,000,000

As a result of its investigation of the water the Hudson, Genesee, and Raquette rivers the Comthe Hulson, tenesse, and Haquetta Fivers Ind Com-mission has located and surveyed four reservoir pro-jects for the development of water power and the control of foods These are the Sacandaga and Schroon Lake reservoirs on the Hudson, the Portage reservoir on the Genesse, and the Tupper Lake reser-voir on the Raquette The Commission considers that the Hudson River, because of its size and the large the risuson filter, because of its size and the large population and important industries of the cities sit-uated along its banks, should receive the first consid-eration in any system of conservation that may be adopted, and it recommends the construction at a acquired, and it recommends the construction at a point on the Sacandaga River, 50 miles north of Albany of a dam and storage reservoir of 29 billion cubic feet capacity. Such a dam would convert 30 miles of the present river valley into an artificial lake of the size of Lake George

The principal object of this reservoir would be to The principal object of this reservoir would be to hold back and score the flood valuers, and afford re-lief during the low-water conditions of the summer to the various power plants along the Hudson. by releasing sufficient water to maintain the level of the river at the desired stage for operation of the Evidraulic plants. In addition to the great benefits attributed by section of the stage of the river

water, the power developed directly in connection with the bit dam would be transmitted electrically to such towns as Albany, Troy, Mechanicaville, Glens Falls, Utloc. Schementady, and other less important communities lying within the sone of conomical electrical transmission. It is estimated that the reservoir would transmission. It is estimated that the reservoir would cost 44,556,000, that the total yearly fined charges and maintenance would amount to \$237,700, and the annual gross carrings \$427,500, leaving an estimated annual not revenue to the State of \$195,000 The Commission estimates that on this basis the cost of the reservoir would be refunded to the State in fifty years it five end of which then it would be the sole years at the end of which then it would be the sole years at the end of which then it would be the sole that the work when the proposal income from the sale of the stored up read an experience from the sale of the stored up read that the work he meter.

The Commission advises that the work be under-taken by the State, because under State control the necessary funds can be provided more economically, and the interests of the public can be absolutely safeguarded it recommends the enactment of a law au-thorizing the development of the power of the Hud-son River, the construction of a storage dam on the Sacandaga at Conkilagrille, the amendment of the Constitution to permit the flooding of State lands constitution to permit the notating of state install in building storage reservoirs to be owned by the State, another amendment providing for a bond issue to meet the expanse of building reservoirs, and the building of other reservoirs to regulate the flow of rivers for power purposes and flood control

### STEEL BELTS.

N Germany steel belts are used in many large factories and electric power stations. The prin-cipal difficulty connected with their employment is that of joining the ends of the beit ends are now provided by the makers with strel plates which need simply to be screwed together. It is necessary to use steel of special quality and temper advantageous to cover the belt wheels with coar 188, to which thin slives of cork are attached in order to prevent slipping. The cork lasts practically forever and reduces the sliding to less than one tenth per cent and requires the site of the control of the travel. Prof. Kammerer has experimented with a steel strap, two-fifths inch wide and one-fittleth Inch hick, with two wheels, eight feet in diameter for the transmission of 16 horse-power with a tension of 40 pounds. Although the wheels were not covered, they worked very allentiv even at a speed of 200 feet per second. The maximum slipping was one per cent of the travel and the loss of energy due to this cause was inappreciable.

Steel belts possess the following advantages stees outs possess the toilowing advantages The energy is transmitted without slipping and almost without loss, the belts do not stretch their width may be reduced to between one-third and one tenth of that of leather belts transmitting the same power, onsequently the wheels may be marrower and lighter and the workshop less darkened by them. The steel belts do not deteriorate appreciably they may be used in damp places and do not appear to be attacked by amoke or acid. They allow the attainment of velocities of 100 feet per second and are consequently very suitable for use with turbines. The required tension natiable for use with turbless. The required tension ion-cental beat than that of eachier belts transmitting the same power, because of the difference in weight from whith results an additional economy, owing to the diminished friction on the bearings. Much room an be saved by using steel belts because their efficiency does not depend upon their length. They can be used horizontally in place of paring. The makers rt that they cost less than leather belts of g

**cuality** The oldest steel belts have been in service two y The oldest steel belts have been in service two years. In a Berlin factory a leather belt 24 inches wide was usplaced by a steel belt 4 inches wide which transmits about 250 horse-power. The belt, after two years use, shows no indication of wear. The only objection to steel belts is that they are not easily seen, and exquently may cause accidents if they are not care-

A remarkable phenomenon was observed during a thunder shower in Finland in the aummer of 1908 by V. J. Laine, who was making meteorological observa-tions for the Finnian scientific society. The shower approached from the east and the thunder, which had approached from the east and the tunner, which had been beard at intervals during a half hour, ceased be-fore any rain fell at the place of observation. Dur-ing approximately the same half hour the eastern hori-son was completely apanned by a double rainbow, which likewise vasilahed before the rain came. Immewhich likewise vapianed before the rain came. Imme-diately after shich peal of thunder the colors of both hows and especially those of the secondary bow, be-came confused and indistinct, and the whole double came conhabd and indistinct, and the whole doubles rainbow appeared to vibrate rapidity. Latine explains bits singular phenomenon, in accordance with the Airy Pernet whoncy of the richlows, by assuming that the confession of the air which produced the sound of thander, also increased the dismeter of the rain drops from less than j/260 inch, to between j/56 and j/25 inch. If this assumption is confirmed it will furnish a wightable contribution, the the theory of these-ders sorress, which is still functional feet.

#### ENGINEERING

According to a recigi dispatch, a contract for the construction, at a cost of \$100,000, of a dam; which will form part of an irrigation scheme in the southern spection of the island of Porto Rico, has been awalful to native engineers, who secured the award in genuicition with four American firms. The total cost of the scheme in \$25,000,000.

The heaviest rainfall over recorded for a single day on the lithmus of Fanama occurred during the great Soud of last Docember, between the hours of 10 A. M Docember 58th and 10 A. M Docember 19th, when the ring gage at Porto Bello showed a fall of 10.86 inches. The total full for the month was 58 17 inches, which is equal to an average rate of nearly two inches a day

The stern frum, radder, and brackets for the new White Star liner Orignoje. Which were recently suppiled by the Darlington Forge Company, are the heavslet ever cent for a stounkibly. There total weight in 339 tons, made up as follows Stern frame, 70 tons, after boss arms, 76 tons, forward boss arms, 64 tons, and radder, 100 tons. The total weight of the same parts as cent for the "Startednia" was 250 tons.

The rapid elimination of the sailing ressel is shown by statistics recently given by a German paper. In the twenty years between 1888 and 1908 the percentage of sailing vessile has declined in the merchant marine of Great Britain from 411 to 124, of Germany, from 23.1 to 191, of the United States, from 307 to 309 I not merchant marine of France, however, but little change has occurred, the respective percentages being 479 and 472.

According to the French paper Matin, the Minister According to the French paper Matin, the Minister of Markins is asking of the construction of two dread-nongists of 33,000 tons such in a programme which has exactly the state of the state

The locomotive recently built for the electric operation of trains through the Cascade tunnel of the Great Northern Railway, where the electrical equipment extends for about its mine, weights about 139 tous and in farmished with four 3-phase 40-brose-power motors working on a 50-broit, Me-gree circuit. The pressure more time in 60-broit, Me-gree circuit. The pressure man and the contraction of the contraction of the circuit within a circuit by water power, has smill ent cause: try for the occusion of sixty miles of the lime.

The Public Service Commission has recently adopted an order requiring the New York Subway operating company to install on all subway cars destination signs, similar to those now used on some of the cars of such train. The company must also post in all six thous, near the ticket office, a map showing the locations, of its routes and the streets intersecting the subway likes; and all stations must be equipped with lite-difficulted signs, piaced on the subway wails, for the Perpose of warring passengers that they are approach-former of the company of the com

Il is olemed that the lighthouse establishment of the United States government is the most complete and efficient in the world On June 20th, 1999, the source included no less than 1,463 lighthouse keapers; and during the facel year of 1910, fit additional lights, requiring the services of 47 Exepars, will be established Legislation in being sought for the seriablishment of three additional lighthouse districts, covering Alaska, Porto Rive and the naral station at Guantamano, and the Hawalian Inlands. The cost of the establishment last year was \$3.574,000

In a recent communication to a New York paper, Mr. Hodoson Maxim shows the futility of attampting to work any serious destruction by the dropping of dynamics from a flying machine. He states that the destruction effected would be very much less than any-nee not acquainted with the action of high explosives would suppose; and that many tens of dynamics might be exploided in the middle of Makions Square without any more serious damage than the Alowing out of the windows of adalount buildings by the rush of air toward the explosion to fill the void formed by the unwhat of the basic gases and air.

#### ELECTRICITY.

Zone than a year ago the New York Public Service Commission of the Second District issued an order limiting the number of passengers that could be carried on each car of the Pine Rillis line in Albany Ther? was so much public dissatisfaction with this restriction that the order has recently been withdrawn.

A report on the its and pole consumption in 1808 has recently been insend by the Consus Bureau. The total number of ties purchased by electric railways for the year vas (48,58,88,6 which, 45,81,156 were been and the rest sawed. A large majority of the ties were and, the number being 3,414,405, chastant comes second with 1,488,138, while Southern pine and codar follow with 144,400 and 830,687 respectively. The number of poles bought by electric railways and electric light and power companies was 83,149, which is considerably jointly of the poles were roder, viz., 286,689, chestant comes second with 186,050

In place of the ordinary windmill type of tower there was for not tower in now beginning to find favor. It consists of two columns apaced a short distance apart and con nected by horizontal members. The plane of the tower is transverse to the direction of the line, and at its upper on the transperse at cross arm on which the transition lines are supported the advantage of the construction over the rigid windmill type is the fact that its case of a break in the line each tower would give somewhat and distribute the strain, thus prevent fing the towers from being pulled over one after the

The Elliacis traction system covers a territory 10 miles wide and 255 miles long. Much new work is being done along the lines of this system which requires the general manager to make frequent trips and a steeper and offers care built. In which he can conduct business while ex resir and which will early min over night from one point to another The managers care is well equipped with all the conveniences that he might desire on his trip. It is provided in the forward part with an office room so arranged that it can be converted into a bedroom with four berths separately curtained off. In addition to this there is a dising room and kitchen. The overall length of the

# SMOKELESS POWDER—METHOD OF MANUFACTURE. -- II.

BY ROBERT G SKERRETT

In the issue of the SCHWITTIC AMERICAN of February 5th it was shown how greatly the improvements in the power of naval guns are due to the introduction and development of smokeless powder The present article is devoted to the description of its manufacture The base of our smokeless powder is cellulose—that enderful and yet indescribable form of matter—Cot

wonderful and yet indescribable form of matter Cot ton is one type of pure cellulose in 1832 Braconnot discovered that starch dissolved in nitric acid and when cleaned in water became an intense explosive. A little later Pelouse obtained the same results by soaking cotton fabrics in that acid

The nitrating house is like a great, gloom laundry the cotton being discuted in or fugal wringers like those in which (lother are washed

and then washing them in water. This was the first step in the evolution of smokeless powder. Because of the great violence and erratic behavior of the explo-sive thus discovered it took years to develop it into a safe propellant More than half a century ago Aus tria and later Prussia used nitrocellulose in their ord nance but its impetuous action could not then be properly curbed and a series of accidents and unex pected explosions caused its abandonment. Years later when the speedy torpedo boat and the rapid fire gus arrived Fr nch chemists through stress of need found ways to check the explosive violence of gun

m and to fashion it into a safe and practical propeliant We followed France but our powder has been the immediate offspring of that produced by the mat Russian chamist Mendaleft

It seems paradoxical that we should seek for a safer It seems paradoxiest that we should seek for a nater and less videox propellant than common guapower by adopting for a base an explosive will known to be more vigorous and more usurily. The secret ideox word by the chemists proved nitrocellusion to be among the common state of the common state of the chemists and the common should be able to the induces of deterrent agents with a smell sole to the induces of deterrent agents with a similar significant in a remarkable way the rapidly with which the granules burn and greatras the property calling gazes. Bonche'ses powed or can now be made in grains of such size and such form that the conditions imposed by each celliber of gaze can be med at the musule welcotty of the shot revulated with auton the medium of the condition of the co ishing pre-kion. Thus the task of the ordnance engineer is now quite opposite to that of former days. To day the gun is designed to meet certain requirements while the propellant is afterward made to suit the gun

Now for the manner in which harmless cotton is Now for the manner in which harmiese cotton is transformed into a ballistic agent at the Navai Pow der Parctory Indian Head Md No offitial servets are betrayed because the value of the process lies in the nies proportioning of the various ingredients com bland with particular forms of grains. These niceties are the outcome of lessons learned after much experi menting in which the variation of a tiny frantion of

an inch may either make or mar the product Cotton when steeped in nitric acid becomes soluble Octon when steeped in nitric acid becomes soluble in a mixture of ether an discloud if the juvice and in the second of the first of the second der is a brother of collection so useful in medicine ar the art of photography while colluidd in its endisses; plications is a flist cousin and lies just beyond the

dividing line of those substances soluble in ether

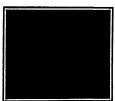

dividing the of those sussesses should be also believe the blooms straight from the fields or the white mill waste in either case the cotton is cleaned by an alkaline both and then well died in an atmosphere of .12 d g F The then well died in an atmosphere of 1/2 d g F The worken to li in this temperature but the p if ct dry ness of the air explains why they are not boiled alive The object of the drying is to make the cotton more, absorptive in the self thus insuring more nearly per-fect nitration. After the cotton has b n dried it is

packed in air tight conisters and sent to the nitrating house where it is soaked for half an bour in a strong mixture of sulphur and nitri a ids. The reaction mixture of suijouit and nitri a los. The reaction frees from the cotton a jer uniage of molature which if not withdrawn would dilut the nitri a id and affer t the character of the jordut Suiphuria acid has a strong affinity for water and it extra is the thus kaying the nitric acid unimpaired and apable of doing its full work upon the cotton

The nitrating house is not unlike a big steam laun

(Cninclingag 11)

ow shows the important precess of shing the cetters in the alkaline both for the purpose of re-moving all traces of ed.

The 'pyren is plied into open tubs, and tre to steaming tanks, where it is belied belied to extract the major part of the rilinging still.

NOT RECEIVED FOUNDS IN MARTINGTONS

# A WAY OUT OF THE MARINE TURBING

Provided that it can be run at the high speed at shield its fall efficiency can be assured, the steam turbles is the most economical of all steam engines On land, as a drive, say for electric generators this high speed of rotation can be employed, since a type of generator may be coupled up that is suitable to that speed. When the steam turbline is employed to drive the propellers of a steamship, it is no longer possible to run it at the best speed for economy, and this for the reason that the propellers of a steamship, it is no longer possible to run it at the best speed for economy, and this for reason that the propeller at the outward end of the turbles shaft shows its own best efficiency at speeds of rotation far lower than those demanded by the turbles, there will be a big ions of efficiency at the propeller if we run the shaft all the maximum-efficiency as they only the turble to see this reproduct if the propeller if we run the shaft all the maximum-efficiency speed of the propeller, there will be no will run in the turble to see this run in the surface.

Here we have a dilemma which the marine engineer has hitherts found it impossible to avoid it. Has has altempted to cut the Gordian knot by a compromise, and has tried to find a mean speed of rotation (too slow for the turbine, too fast for the propellor) which would give the best or rather the hast bad results on the 'road per homespower per hour' basis If requires no very keen discernment to perceive that the solution of the problem lies in the selection

It requires no very keen discernment to perceive that the solution of the problem lies in the selection of some suitable appropriate, and as far back as 1904, in a report to George Westinghouse, George W Meltilla, for former Engliseer in Chief of the Navy, and Mr John II Markhjube, made the following astasment; the former Engliseer in Chief of the Navy, and Mr John II Markhjube, made the following astasment; that the selection of the turbine with the comparatively low rate of revolution required by an off-ineal propeller, the problem would be solved, and the turbine would be a stroke of grant facelies.

intervening years three entirely different methods have been devised for meeting the difficulty One is to install high-speed turbo-generators, and utected to the propeller shaft and experimental work in this direction has given such good results that the o River Shipbuilding Company recently put in a for the equipment of our 26 000-ton battleships with an installation of this character. In another ave known as the hydraulic reduction drive, two hydrault turbines are interposed between the steam tur-bine and the propeller the one connected to the tur-bine the other direct-connected to the propeller, with controlling valves between the two which enable the speed to be reduced to any desired extent. For both of these systems it is claimed that high efficiency has been secured. The third method (the one shown in the accompanying illustration) consists in the use of a mechanical reducing gear During a series of exhaust-ive tests recently made at the Westinghouse shops, this experimental gear showed the astonishingly small friction loss of one and one half per cent. These results are far superior to those obtained with the other two methods, and unless some unforceen disadvantages should develop when the full-size gear comes to be installed on a warship or merchant steamer it may safe ly be said that in this reduction gear has been found the final solution of the marine steam turbine prob

Il was no easy tank to devise a gearing which would in a monthly and without excessive wear at the was mostly as process required for steam turbines, and at the same time transmit the thousand to home-power post interest to home the way to the properties shafts, which amounts in the case of the Waserschaft a hount 18,000 home-power post of the Waserschaft a hount 18,000 home-power post in the first page of this issue was constructed at the wind in the high the shaft was the shaft of the waser than the waser than a large of the waser than the waser thas the waser than the waser than the waser than the waser than th

As will be seen from the illustrations, the pears are helical that is to say, they do not run straight across the face of the wheel parallel to the axis, as in the case of ordinary sour gears, but they are cut in the form of a steep spiral. This construction allows the wheels to roll into contact without shock or jar. Of currse, this helical form of tooth causes a strong end thrust in the direction of the axis of the shaft, and in order to prevent this, sue-half of the gear was cut with the spiral running in one direction and the other with the spiral running in one direction and the other way the end thrust, due to the obliquity of the testb, is completely belanced.

In spite of the marvelous accuracy with which the teeth of gears can be cut by modern machinery, it is impossible to form them so truly and align the shafts so perfectly as to get an absolutely uniform contact throughout the entire length of the gear This is an

important consideration in all gears, but becomes doubly so when, as in this case, they may have to transmit from ten to twenty thousand horse-power. The inventors have mot the difficulty by a very in-

The inventors have met the difficulty by a very ingenious construction designated as a feating frame,
which they describe as follows: "The remove which
carries the hearings for the pintion is a heavy steel
castless empoyered only at a single point of the castless of the pintion, but is held securely
against mettion in any other direction. Furthermore,
the pinton is free to move endwise in its bearings
any instance, of the teeth to bear harder at one end
of the gear tians the other would tend to unbialence
the respective end thrusts due to the right and lefthand spirals of the teeth, but as the pintion cannot present any resistance to unbialenced end thrust, it constantly adjusts itself in the direction of its axis to
the position corresponding to equilibrium between the
opposing forces. This means that the tooth contact
pressures are always automatically equalized.

ressures are always automatically equations. "If there are any insular foregularities in the spacing of the teeth, which would tend to make the contact harder at one point than another in any part of the revolution this tendency is defeated by the floating frame, the position of which about its central support or faircrum is controlled solely by the pressures of the testh of the plares are Naturally, the floating frame always yields under the eath of the testh of the plares with the support of the position of the positio

The grat was tested by means of a special hydraulic brake, the reduction gare being interposed between the turbine and the brake, and in six test the brake horse-power delivered by the gare at different speeds varied from 3,712 to 5,327. Since there is no way in which to measure the indicated horse-power of a steam turbine, it was necessary to establish the exact brake horse-power in some other way. Fortunately, it is a characteristic of the steam turbine that, as long as the speed and exhaust pressure are maintained contant, the absolute index pressures or commercially dry steam is a very accurate measure of the brake horse-power the turbine is developing, decoratingly, as dynamical extensive the steam of the

A reliable check noon these results is afforded by the rise in temperature of the oil with which the gear is lubricated since the transmission loss in the gear appears as heat in the oil By measuring the quantity of oil circulated and noting its rise in temperature, access approximation to the number of British thermal units lost per hour is obtainable when he gear was delivering £0.88 horse-power, £61 pounds of oil were circulated, with an average rise in temperature of \$2.86 deg. F. from which it follows that the total heat absorbed per hour was \$14.205 British thermal units each sold per hour is the sequence of the personal person of the sequence of the person of

reason With these results before him, Mr Westinghouse has made an investigation of the scopessies which could be sourced by applying the gast to the Consender "Meatricials" and "Lusitania," which are such explained to the Onzarders "Meatricials" and "Lusitania," which are such explained to the Consenders of the Conse

probably dose, set exceed, it per out. If we, the actual effective propelling power is only about \$18,850 horse hower. At the favier eject of revolution resulting from the one of the recipitor great, propellers could be installed that would have an efficiency of not less than 85 per onni; which means that the shad horse-power required for the same affective propelling power would be actually to the same affective propelling power would be actually to the same affective possible power would be actually to the same affective possible power would be actually to the same affective possible power would be actually to the same affective possible power would be actually to the same affective possible power would be actually to the same affective possible power would be actually to the same affective possible power would be actually to the power and the same affective possible power would be actually to the power and the same affective power and the same affective power would be actually to the power affective property and the power power and the power power power and the power power power and the power pow

equipment and the coal consumption on such voyage abent consumption. On the control of the concentra at the propoller than the control of the

Now, the steam consumption of the turchines of the "Marstanian" is believed to be should 1.6. pounds per shart horse-power per hour; but it has been proved that it turbines of similar capacity, operating at speeds which the reduction gear makes possible for marine service, the steam consumption does not exceed 11 pounds per shart horse-power per hour. This means service, the steam consumption does not exceed 11 pounds per shart horse-power per hour. This means service, the steam consumption does not exceed 12 pounds per shart horse-power and the total efficiency of the whole propaller, could be further reduced to about 45,000 porse-power, and the total efficiency of the whole intillation would result in a reduction of over 35 per cent in the coal consumption. These vessels burn about 4,700 tons per vorage, and since the coal coats about 4,700 tons per vorage, and since the coal coats of the coal coats that the coal coats that

to the eargo capacity
But there are further economies, as will be seen by
reference to the illustrations on our front page, which
show the space occupied by the present turbine equipment of the "Mauretania" and that necessary if small
ship-hoped turbines combined with reduction generawers employed on three propeller shafts. These recomment is unnecessary and further
comments as monocessary.

All the advantages that would result from the supplyment of this device on merchant steamers would be realized also on naval vessels, together with other collateral advantages due to the fact that the high-speed turbins would not suffer the large drop in econ only which results, in the case of the present turbins, when they are operating at cruising speeds. With the superior steam economy of the high-speed turbine the bolier capacity would be reduced fully mathird, and with the same bunker capacity the radius of action with the same bunker capacity the radius of action to the composity increased—a consideration of insalents he may be considered operations of insalents and the strength of the s

#### THE PIECE "ALL-BIG-GUE" SHIP.

The states "Allocate over 1 mars,"
To the Editor of the Scientific Assurement States on In glancing over your issue of Novamber 20th, I was struck by your correspondent's interesting article, "A Dreadnought of 1863" However, does it not seem Dreadnought of 1863." However, does it not seem more logical to go back a year earlier to Ericsson's "Monitor," which was without doubt the first "all biggun" ship built. The "Roanoke" was really a combiation of the "Merrimac" and the "Monitor" like her antagonist, a rased frigate, and resembling the "Monitor" in the matter of her turrets, therefore, it appears that the "Monitor" was the original dreadnought, and the present mighty vessels of that class are but the design of the great Swedish American engineer applied to occan-going vessels. For be it known that Ericsson never intended to employ the "Monitor"

#### MONTING A RIPLE.

## To the Editor of the Scientistic Am

I was interested in Mr Woodland's article. "Sighting a Rifle," in your January 22nd issue, and I would like to mention a point which I think he has over looked, vis., the jump of the rifle looked, viz. the jump of the rifle. This term refers to the angle through which the barrel recoils while the projectile is traversing the barrel. In off hand shooting, the rifle recoils upward, and sometimes slightly sideways about a center which is probably a little forward of the butt plate. The correction for this should be applied to both sightle, and directly proportional to there! distance from the center of proportional to the rear sight is very near this center, and has but as the rear sight is very near this center, and has little vertical movement due to the jump, it is suffi-ciant to slovate the front sight through this angle (This is done by the manufacturer, notice the high front sight of a six shooter which always has a con-siderable jump) Mr Woodland's plan was evidently to make the correction on the rear sight only, and while this would been the forest sight leaves and while this would keep the front sight lower, and would correct the angle of jump, it still introduces a constant vertical error at all ranges—an error equal to the vertical movement of the front sight While this is small, and perhaps negligible for the 0 22 call bers, it would still affect his calculations slightly The bullet would strike a little high, tending to intersect the line of sight nearer in the ascending branch farther in the descending branch of the trajectory Chappaqua N Y

## CURIOUS PACTS ABOUT SQUARES AND CURES

I have discovered the following curious facts about squares and cubes. These facts, in my opinion, are interesting from a scientific point of view besides be-ing of some practical use I shall be very glad to have you publish them if you doem them of sut worth

1 To be a square a number must have for its unit's digit one of the digits 0, 1, 4, 5, 6 or 9 This, of course, is well known but I put it down as an aid in understanding the other facts.

2 To be a square a number, if its unit's digit be 0, 1, 4, 5, or 9, must have for its ten's digit 0, 2, 4, 6, or 8, 1 e, the ten's digit must be zero or an even or 8, 1 a, the ten's digit must be zero or an even number If the unit's digit be 6 the ten's digit must be 1, 3, 5, 7, or 9 i a, an odd number if the unit's digit be 5 the final digits of the number must be 025, 225, 0625, or 5625 If the units digit be 0, there must be an even number of zeros at the end of the numb

3 A number, to be a square, must have as remainder when "nines are cast out" of it either 0, 1, 4, or Since the sum of the digits of a number gives the number remainder when divided by 9, as when the number is divided by 9, this test is easily applied by dividing the sum of the digits of the number to be tested by 9. To this test I can give an algebraic proof

4 A number, to be a cube, must have as remain-der when "nines are cast out" either 0, 1, or 8 This fact also I can prove by means of algebra
I can furnish you with a device, if you desire it, by

means of which, the squares of the numbers 1 to 25 being given, the squares can be written off in order od libitum without any multiplications Normal School, Peterboro

## MIM PROE AND MRS. WORKHAM.

To the Editor of the Scientific American
After her ascent of the lower north peak of Mount
Husscaran in Peru in 1908, Miss A Peck wrote in
Husper's Magazine and in other periodicals and papers the following

regarded as certain that Huascaran is above 23,000 feet, hence higher than Aconcagua, 22 800 feet, and the loftiest mountain known on this hemis phere If, as seems probable, the height is 24 000 feet, I have the honor of breaking the world's record for Knowing from her own statement that Miss Peck made no instrumental observations above 19,600 feet on Husscaran, and believing, furthermore, Aconcagua to be the highest mountain of the Andes, I decided to test the truth of these assertions by sending expert san engineers to make a dotatled, up-to-

European engineers to make a dotailed, up-to-date tri-angulation of the two summits of Mount Hussearan. The only provious known measurement of this mountain was made many years ago, which is said to have given a height of 22 180 feet for the south or

Prof Schrader, who a few years ago made the most suthentic measurement yet made of Aconcagua and M Henri Vallot, both well known French scientists and heads of the Société Genérale d Etudes el de Tra vaux Topographiques of Paris undertook to assist in getting up the expedition, and gave the matter their

close personal attention

M de Larminat, expert engineer who has carried
out important survey work for the above society was selected as chief of the mission in July 1909 ac companied by two other competent topographers, he started for Peru

Favored by good weather conditions and assisted a to transport by the Peruvian government they ex-cuted a careful and detailed survey from the sea to Yungay and by actual measurement established the heights of four stations in the Black Cordillers, from each of which they triangulated the two peaks of Huascaran, so that Huascaran now stands as one of the most accurately measured high Andean moun-

The results are Height of north peak climbed by liss Peck, 21,812 feet, of south peak still unclimbed, 22 187 feet These figures may vary by a few feet but not many when the calculations are finally gone over by M Vallot for verification

over by M Vallot for verification. Mount Aconcagua nearly 22,900 feet, still remains, as I predicted and as Sir Martin Couway and other Andean explorers have always maintained, the highest peak of South America

Miss Peck's highest ascent to data therefore stands north peak Huascaran 21812 feet instead of 24 000 feet, as she estimated it, and she has not the "honor of breaking the world's record," either for men or women, for my two highest ascents of respectively 22 568 and 23,300 feet debar her from that honor in the case of women while a number of men have made accenis exceeding her highest

# t Kinematograph **Biffe** Target,

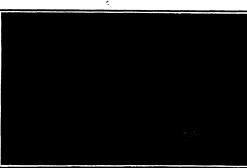

Among the novel uses for which animated photographs have been utilised one of the most inge is that recently perfected Messrs. J Paterson and J T Musgrave This is its application to rife-fire actice, the idea being to render the eye of the marksman keener, and to enable him to be more pert in the quick handling

The "bioscope target," as The "bloscope target," as it is called, is of very sim ple construction and opera-tion. There are two roll-ers, upon which is wound a sheet of paper of any de-sired size, like the films of a camera, the clear space between the two rollers comprising the screen upon which t

tures are thrown The lantern is placed behind the markmann in such a way that their novements do not interrupt or interver this the protection. Inmediately behind this provement of the protection of the protection of the intervent of the interv ablement, and so on. The indicator not only municates the individual hit, but at the complet the round, or practice, registers and gives value of hits made.

value of fits mass.

The range can be varied from 15 to 25 yards as desired. The paper across as it is destroyed by the bullet perforations is wound up on the second roller. The self recording uncohanten behind the screen is so prranged that it absolutely synchronizes with the movepranage that it accordingly procurement with the sevents of the object in the picture, at which aim is taken, so that there is no possible chance of a wreng value being given for an individual shot. The indi-cators are placed immediately, show the unrimment bead at the firing position, and a factal the can be signified by the ringing of a bell. as with the ordinary

Grand panerams from Robe Mountain. Looking due south from the Lowe Observatory Land area is 200 square ratios. The cloud as exactly over Passdera. The observatory as shown in the foreground. Less Angeles is to the right of this view

THE LOWIS COMPRISATORY OF MOUND MODIFFATH, GALLFORNIA, U.S. A.

a nevernest of starry sand. I never really saw this real base until with the telescope up here. After several days of rain, the atmosphere is swept clear of severs; carys or rain, the atmosphere is swopt clear or dust Then one is really within cosmic deeps when the tolescope suddenly sweeps over fathornless inter-stellar chasms, doors or windows through which one apparently looks into the very bottom of space. These areas are absolutely black. No sensation within the entire range of stellar research, at the hour of a mountain midnight, is so completely overpowering as mountain minningst, is so complessly overpowering as the vision of an abyse in the stallar foor Rousd and about these blackened wastes, there are cases where the stars are pilled in heaps, raked into wind-rows, or strew out this wings, streamers, diaments, and spray Yet of all these stellar houts the timiest oint may be a white hot sun, and larger than our

little star—the sun The giant nebula of Orion is a mass of starry is a fabric loaded with glittering points.

a more connect with gittlering points.

An astronomical telescope reverses all objects heaver
it. The rotation of the earth is very suparent on Bobb
Monntain. With high powers, the stars go racing
across the field of view. An increditly starting effect
is obtained when the telescope in set upon the Gislaxy
or Picindes just as they rise out of some distant pask,

buil's any target. The pictures, which have been specially prepared for use with this apparatus, are of such a character as to develop the calerity and certainty of the markaman's aim to the suprame degree. on the enemy appearing on the picture first at a relative 100 yards range. He drops

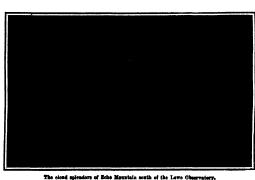

on his kuse and fires point blank at the marksman a certain number of rounds, corresponding possibly to a complete charge of his rife magazine. The marksman using the target raises his rife immediately the kinematographic cout is seen, but do scout is seen, but does not commence firing until the scout opens fire, the ap-pearance of a puff of smoke in the picture indicating the commencement of firing

The scout then retreats at the double to a distance corresponding to 200 yards range, when the same cycle of operations is repeated The scout then retires once more until he reaches a point correspond ing to 500 yards range, and the same tactics are once more carried through It will be seen that in each phase the target becomes decreased in size, according to the range, and at the maximum range offers a very small object to the marksman Moreover, the fact that the latter has to discharge the whole of his rounds in the short period tween the picture scout mmencing and finishing firing at each distance, in order to score, indicates that aiming and firing must be accomplished very quickly found t Yet it has been that in the course of but little practice, the marksman can pick up the range and conform with the firing conditions so ex-pertly that about ninety per cent of fainl shots can got in with each round at the respective ranges The invention is also ap-plicable to training in re-

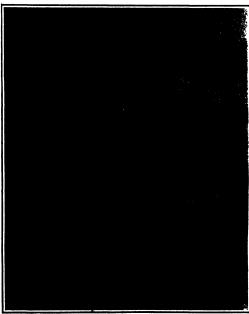

volver shooting, and for this work an ingeniously suitable film has been pre-pared. It portrays a con-flict with an armed housebreaker The burglar effects his entrance through the window, under which in the room, a roll top deek is drawn at an angle In the course of his work the burgiar is disturbed, presumably by someone entering the apartment. He instantly shields himself behind the desk, exposing but his head and shoulders, and cocks his revolver The burglar's disturber is represented by the marksman at the fir-ing point, who at the psychological moment the burglar is about to fire, empties his revolver In pties his revolver empties his revolver In this act the burgiar pre-sents a fair-sized target, with his protruding head and aboulders at a few pards range. The burgiar having emptied his arm turns to escape through the window, but in the act

the window, but in the act of dropping from the sill, to which he clings by one had been been as the best, and drawing his revolver case more, free. The markening waits until he one the burghar's head right spaces and past about the price and then shoots. In this case, within the protect was and the small sees offseed by the man's head and includered in possible, the sees softened to the marks and and includered in possible, the sees softened to the marks.

man's aim is somewhat small. The burglar indicator represents in silhouette the head and shoulders of the burglar in the two firing positions, and the vulnerable points of this part of the anatomy are shown on the indicator, so that the firer can instantly determine ther he has struck the target in a fatal spot, has

THE LOWE CHERVATORY ON ROHO MOUNTAIN, CALIFORNIA, U. S. A. inflicted a mortal wound, or has either missed entirely

or only inflicted a firsh wound

or only inflicted a feel wound
The projection is automatically controlled
The instern is electrically driven by means of a small motor, and this is operated from the fring position by
means of a small switch. The same picture can be

projected time after time, there being automatic de-vices for winding and rewinding the spool preparatory to projection Being electrically driven, a uniform to projection Being electrically driven, a uniform projecting speed is secured, and as it is directly under the control of the marketone is rol of the marksman the apparatus is only set in action when required

The idea can be de ed to an indefinite extent, ed to an indefinite extent, and the variety of pictures that can be used for im-proving the fire of the markeman is endless. It can be adapted for individual or company firing, and very realistic scenes can be pittorially produced. The application of the bioscope to this phase of military training often been advocated and attempted. indeed hut hitherto it has been found difficult to evolve a practi cal simple apparatus. The British War Office has inrestigated and subject the invention to searthing tests, and has ascertained that marksmanship can be o rapidly improved by this means that its general introduction into the service is being contemplated.

A new method of bond ing new concrete to old was described by Mr Frank Barber, of Toronto, in a recent article in the Canadian Engineer This consists in placing bags of cracked ice on the last ces of concrete placed at night, thus reducing the temperature of the con crete and, consequently, retarding its time of set ting, so that on the next morning the surface is still plastic and the con crete then placed will set in one mass with the old The invention of this O L. Hicks, when he was contractor for a reinforced concrete truss bridge in Ontario As all of the members of these trusses is credited to Mr were of relatively small cross section the ice bags were easily placed in post tion, at the end of a day's work and it is stated that the method worked very successfully To what ex tent it could be applied to heavier work is not as yet knosn

Hitherto dew has been used as a beverage only in poetry, by the sun, flowers, and butterflies It has re-cently been robbed of all its postle character by be ing used for the refre ment of English soldie The English administra-tion at Gilbraliar, where water is very scarce, now collects dew by the follow ing very simple method A large pit is dug in the earth and covered with dry wood or straw which, in turn, is covered either with earth or with sheet fron The straw or wood serves as a heat insulator and effectually prevents from the ground to the layer of earth or the sheet

E. A. live of earth or the sheet iron, above Consequently this earth or iron cools after sunset much more rapidly than the ground so that its temperature soon falls below the dew point of the surrounding air Hence dew is formed upon the iron or the layer of earth in very large quantities.

The water thus obtained is drained off into reservoirs and after clarification is used for drinking

# MORNING AND EVENING STARS FOR 1910

BY PROF. FREDERIC R. HONEY, TRINITY COLLEGE

The popular expression 'morning and evening stars' while signifying those planets which at different periods illuminate our skirs, the observer will natur ally include in his study of the heav us the fixed stars name indicates that they will be invariably

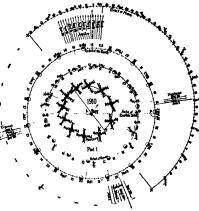

found in the same places on the coles tal sphere. Their positions in the ceres that sphere. Their positions in the heavens may be seconer fixed in the memory by first observing the stars of higher magnitude, whose conspict on brightness casily distinguishes them from those of varying degrees of lesser brilliancy in this way the heavens may be triangulated visually, and in process of time all the constellations may be easily identi-fied. For such observations a star map is indispensable, and the post-tions of the stars should be located by right ascensions and declinations which are given in the Nautical Almana. The position of the celestial equator from which declinations are measured may be determined ap-proximately by observing the stars which are near it on the star map, and in the same way the position of the first meridian intersecting the celestial equator at a point from which right ascensions are meas-ared, may also be defined. Following this method seven eighths of the celestial sphere (at latitude 40 deg.) will come within the range of vision, and the heavens may become an "open book" The distances to the fixed stars are so great that ( x ept to the astronomer) their apparent positions are not disturbed when the earth reaches the opposite point in its orbit—a distance equal to about one hundred eighty six million miles. For purposes of observation the earth may therefore be regarded as

the unter of the celestial soliere around which the stars appear to revolve once in a sidereal day, which is mearly four minutes shorter than an ordinary day, a difference due to the revolution of the earth around the san once in 165% days. During this period the earth makes 3561; rotations on its axis. As a conse-quence the stars rise nearly four minutes (arilar every day, and during the year the major part of the celes tial sphere comes within the range of vision at any assigned hour of the twenty four. The positions of the planets are continually changing, and in or

der to discover the region of the honvens in which to search for them their situation rela-tive to the sun and earth should be determined as illustrated in Plots 1 and 2 plots of their orbits have been printed in the Me twith American in the Issue of the following dates March 17th, 1908, February 18th, 1908, and March 1907, February 18th, 1908, and March the 1908, and the positions of all the planets are shown for every day of each year. Toare anown for every day of each year. To-gether they exhibit the courses of all the plan-els for the five consecutive years from 1906 to 1910 inclusive. The orbits of the aster-olds which are between those of Mars and olds which are netwen those or many and Juplier, Saturn, Uranua, and Neptune, are too small to be visible to the naked eve, the largest of over six hundred being not more than five hundred miles in diameter. Several of he orbits are very eccentric and inclined at large angles to the plane of the ecliptic

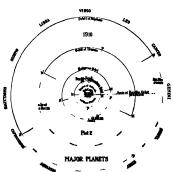

In order to bring the plots of the orbits of the planets within the limits of this page, the the planets within the limits of this page, the orbits of the terrestrist planets, which taclude Mercury. Venus the earth and Mars, age drawn to as large a scale as the space perdrawn to an large a scale as the space per-mits. Since the diameter of Neptune's orbit is thirly lines that of the earth, the plot of the orbits of the major planets, including Junius Ratura, Uranus and Neptune, are drawn to a sais which is very much reduced. In this pile the orbits of the arth and Marse of the orbits of the arth and Marse of the orbits of the arth and Marse attention to the contract of the arthur of the asteroids or minor planets and the arthur of the sacrodies or minor planets and the arthur of the large the rabos the continuity of the large that a the arthur plane of this ways rank to be the to correspond the

plane of this paper may be taken to represent that of the ecliptic or the earth's orbit, and if it be placed in n horizontal position a planet which is on one side may be described as being situated above and on the other side as below the celliptic. In the plot of each orbit the full line represents that part which is above, and the dotted line that part which is below the and the dotted lite that part which is below the ectip-tit. The seconding and descending nodes N and N are respectively the points where the planet passes from the space below to that above, and from the space above to that below the ecliptic, and P, the peribalics,

is the point of the planet's nearest app A line joining the points N and N', the line of nodes, is the intersection of the plane of the planet's orbit with that of the ecliptic To avoid confusion, only a portion of this line is represented, except in the case

It is obviously impossible to represent the diameter of the planets by the same scale. Even those of the giant planets Jupiter and Saturn would shrink to mere The same may be said of the sun itself in Plot

PLOT IL .-- PLANETARY ORBITS.

2, but in Plot 1 its diameter (\$66,490 miles) would be and the riot i its channels (\$66,600 miles) would correctly represented by a measurement a little methan one-half of e, which is the linear eccentricity the distance from the sun's center to the canter of the can earth's orbit

The earth's mean distance from the sun (929 milli miles) is diminished by a little over one and one-million miles at perihelion in January; and increby the same distance at sphelion in July The center of the orbit is at a. At a velocity of 18.5 miles per second the earth moves each day on the average nearly 1,500,000 miles, with an increase of velocity at perhelion and diminution at aphelion; making the complete revolution in 365% days. The

position of the earth is shown at in tervals of four days at Greenwick, noon, and intermediate positions and dates may be interpolated by subdi-

The plane of Mercury's orbit is in-clined at a greater angle (7 deg.) than that of any other of either the terrestrial or major planets. Its-co-centricity is also greater than that of any of the planets. By the eccentriccenter of the orbit to the sun (the linear eccentricity) divided by the semi major aria The linear eccen tricity is 74 million miles, and the length of the major axis is 72 million miles. Mercury's mean distance from the sun is therefore thirty-six million miles with a diminution and is of 74 million miles respectively at perihelion and aphelion At perihe-lion the planet moves at a velocity of thirty five miles a second, which is diminished to twenty-three miles a second at aphelion Mercury's orbit is a marked illustration of the first two of Kepler's three laws First The orbit of each planet is an ellipse, with the sun in one of its foci The radius vector (1 e, the orbit radius whose length is continu-ally changing) of each planet desoribos equal areas in equal times. For example, the area of the triangle with the sun as its vertex, and with a base equal to that part of the orbit

a base equal to that part of the orbit included between the dates of August 30th and Sep-tember 7th, is equal to the area of the triangle with the same vertex and for a base that part included be-tween the dates October 9th and October 17th In cen formity with the second law, the length of the base of the triangle is continually diminishing from perihelion to aphelion, and increasing from aphelion to perihe

to aphelion, and lacrossing from aphelion to perfile
lion, which accounts for the might variation in the
planet's velocity. Merry's revolution around the an
a accomplished in very nearly eight-yeight of
(87 97). This is repeated over four times
during the year, and four dates are attached
to each position. Owing to the great variation
in the planet's velocity the positions are
shown for every second day.

VENUE The orbit of Venus is inclined to the plane of the ecliptic at an angle of 34 deg. The occentricity is less than that of any other planet, and is barely visible in the plot, the distance from the wun to the center of the orbit is less than a half a million miles. As a consequence, the velocity of the planet in its orbit at a mean distance of 672 million miles orbit at a mean distance of 873 million miles is nearly uniform at the rate of 219 miles presented.

The period of revolution is 2247 days. The dates outside the orbit are those which belong to the first revolution, these within, to the second revolution, and that part of the orbit included between the positions of the planet for the first and second those of the planet for the first and second travalutions. revolutions represents the distance traverse in seven-tenths of a day

MARS The orbit of Mars is inclined at an angle of 1.85 deg.; and the center c is 13.2 million miles from the sun. The mean orbit velocity is fitten miles per second, and the mean distance from the sun is 141.5 million miles. The

period is 1.85 years.

The inclination of Jupiter's orbit is 1.8 deg. with a linear eccentricity of 22.3 million miles.

The inclination of Jupiter's orbit is 1.8 deg. million miles.

The state of the

# CURIOSITIES OF SCIENCE AND INVENTION

#### A STREET BAILWAY AUTOMOBILE

bile street railway has recently been installed for regular passenger service between Manda-ville and New Orleans, La. The cars are each fitted

A STREET BAILWAY AUTOMOBILE

ing them practically automobiles on rails. The line is ing them practically automobiles on rais. The line is 16 miles long, and steam motive power has been in-stalled in order to reduce the cost of maintenance. Two street automobile cars built as an experiment have proven so successful that more are now under Each car is built to seat twenty-two people, and the expense of maintaining the line under present power permits of a large saving over the ordi-nary electric street railway maintenance.

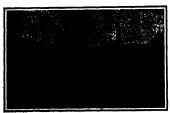

GALILEO'S TELESCOPE.

Just about three hundred years ago, Galileo exhibited a telescope which he had used in studying the moon and planets. This was not the first telescope

THE FIRST ASTRONOMICAL TRABSCOPE.

awe rount, out it was neveror to a risk tenecopy as be used for satronomical purposes. The accompany-ing engraving shows how the telescope locked. This type of telescope differs from the present astronomical type in using a concave instead of a convex eyepiers, so that by a combination of but two lenses, the object glass and eyepiece, he was able to view objects right

SOSSEE PROPERTY BY MOTOR-BRITER SPURSED WHERE.

side up, whereas in the present astronomical tale-scopes objects are inverted. The Galilean type of tele-scope is now used in the ordinary opera glasses. With this crude instrument Galileo was able to establish the fact that the moon is a round body with its surface broken by mountains, that the Milky Way is com-posed of countless stars, that Venus and Mercury have phases like the moon, and that Jupiter has a number of satellites (four were discovered by Galil him Saturn appeared to be a triple planet. This pus-sling phenomenon was explained fifty years later by Huygens, who discovered that the planet was surded by a flat ring

AF EGG WITE A TAIL.

Occasionally, for one reason or another, a hen will lay a "soft-sholled" egg, but one with a tail, like that shown in the accompanying photograph, is decidedly unusual This egg was evidently the last or

AN EGG WITH A TAIL

a clutch, and, though the hen lacked material for a shell, she had a surplus for the shell lining, or egg

#### A FROEEN TELEPHONE CABLE

A PROBEN TALEFRONE CABLE
The accompanying photographs shows the effect of
ice pressure on a twenty five pair lead telephone cable
The cable was located in a three-inth iron pipe, and
was run underground for fifty feet between the terminal pole and the manhole in the street. Owing to a fault in the construction of the lateral, the pipe di not drain into the manhole, which allowed water to collect in the pipe for a distance of about twenty feet.

THE REFECT OF ICE ON A TRLEPHONE CABLE

Last winter being an extremely cold one caused this water to freeze in the pipe, the pressure crushing the cable out flat. In several places there was a quantity of small stones and gravel in the iron pipe and so strong was the pressure of the ice in the pipe that strong was the pressure of the fee in the pipe that these stones were forced into the armor of the cable as though driven in by a hammer. The wires had the numal paper insulation, and the extreme pressure forced the wire through the paper at every twist of the conjustion. The cable was denied and crushed for a distance of twenty feet.

#### MOTOR SCOOTERING.

Some years ago an amphibious craft was invented at Great South Bay Long island which could be maneu-vered on ice as well as in the water. It was in reality an icebest provided with a flat-bot-

an icross provided with a finitoric tomed hull which would font the craft in case of oncountering a blow-hole or break in the ice. The sport proved to be very fascinating, particularly the peculiar sensation of plunging off the ice into the water and then climbing back again The and then climbing back again The "secoter," as this craft is named, is now undergoing further development, Instead of depending upon the sail for power, Mr Nat Roe of Patchogue, L. I. has equipped his scooter with a 30-horse-power motor and a surveyed wheat which dies and a spurred wheel, which digs into the lee and drives the craft along He claim to have traveled over the lee at a rate of 90 miles There is no mes propelling the boat while in the

water, but the sport consists in leaping gaps in the tee by the sheer momentum of the craft. H The seaped gaps of over a numered fort in this way. The motor scooler possesses and advantage over the motor sled, because it cannot sink in case of breaking through the lee, and over the sail scooter in the fact that under its own power it can be taken home over snow-covered roads when the owner knows (itsed of

#### LARGEST PROJECTILE IN THE WORLD

The accompanying illustration is of more than ordin ary interest from the fact that it shows the largest

LARGEST PROJECTILE IN THE WORLD

and heaviest projectile to the world being the bugg 5-foot, armor piercing shell fired from the United States governments great is inch rifk. Phis giant d powerful gan are considered two of the r such and powering that are consumered two or the mone-destructive and dendly engines of warfarr in exist-ence. The monster (b-link) rifle the only one built so far is now at the Sandy Hook Proving Grounds, and has only been fired a two times. The huge shell of trade of the best of the control of the of steel can be huried a distance of 20 miles or mor and weights 2 100 pounds. The powder charge is nearly 500 pounds. The cost of firing one shot reaches in the neighborhood of \$1000 its not probable that this type of gun will be used but rather the 14 inch for the main coast defences of the Panama (anal and possibly the Philippines. This formidable and long range weapon though capable of firing so tremendous a projectile is too costly and files too slowly for modern

INTERLOCKED MOOSE ANTLESS

A curious relic of a fatal battle between two built moose is shown in the accompanying fillustration. The battle was fought in the Kenni Peninsula Alaska a few years ago. An indian was attracted to the spot by the noise of the encounter, and on nearing the two antagonists he found that one had broken its neck during the struggle and lay dead on the ground while the other partly exhausted was making desperate of forts to free his horns. After killing the latter moose the Indian tried in every way to separate the antiers but found this to be impossible. The interlocked antiers are soon to is exhibited in the collection of heads and borns in the new Administration Building of the New York Zoological Park. The larger pair of horns has a spread of 69% in hes and the other of

RELIG OF A BATTLE BETWEEN TWO RULL MODE

# THE DESIGN FOR THE NEW QUEBEC BRIDGE

COMMONPLACE IN APPEARANCE AND COSTLY TO BUILD

The collapse of the hope and lies or bridge at Quebe on August 24th 1967, was at one the structured and mant fatal admeracylate in all the library of bridge construction make not or modern. When that collosed structure broke down under the own wight and disposard from shigh the his Vane run. River more than rights homosa lives and only of structure. Nature that the shight has been all the same for distinction. Nature that the shight has been distincted by the shight has been distincted by the shight has distincted by the shight has distincted been could be shade, could be shade could be read earlier of the structure of the shight has of prestigate to the rather when were commerted with the work, and distinct the shight has been shighted by the shight has great promising to of the bridge was due to the fact that it imbuilted the longest span (1,00 feet) yet accurately of This was longer by 30 feet than either of the shight in the shight in the shight in the largest leither in the shight in the shight in the largest leither in the shight in the shight

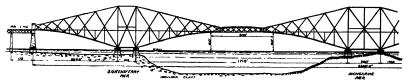

An investigation of the facts by a Royal Commission revealed as the cause of the collapse faulty design of the compression members—it was ascertained that the slightest attempt to combine the beautiful with the useful The faulty structure with collapsed had at least the redeeming feature that the outlines were structurally and sathetically correct, and although the both Bridge has been made the subject of much crititism by the arrist and the architect, it must be regarded as having distinct claims to beauty when compared as on the arcompanying page, with the new plans for the quebes Bridge

pilant for the Quees irrupe
It would seem, however that the Board has some
double as to the meritar of its own work, for its
will competite the transport of the own work, for the
next the contractor's own exposes. But if the Board has
taken eighteen months' time and spen, it 10,000 to preduce the present plans, the public will naturally safe,
If ow can the Board oxyper temporabilité firms to fur
high them with new plans in one-sixth the time and
for nothing?

The lay of the land at the Quebec crossing is such as to make it almost certain that a thoroughly rigid

pressure during high gales, and particularly is this provision necessary to insure safety during srection. The bridge which failed was only 87 feet what data small width was a large contributing cause to the viriting of the structure during exection, which precided its collapse. This important fact does not seem to have been given sufficient consideration, for the new structure has a width of only 88 feet, or one to still the proposed length of gane of 1,78 feet, as against one-fourienth in the Forth Bridge it may be included that carrentees with American.

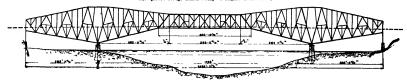

It may be cialmed that experience with American practice in centilever pailmed bridges has shown a proportion of 1 to 20 to be sufficient, but it is a question how far their immunity from disaster during erection was due to the fortunate circumstance that strong winds were experienced—such as frequently occur at the Forth Bridge, and may occur at Quebox—which south have twisted IN transes out of shape-bridge they had been therefore the dark three of the property of the control of t

One-half of the cantilever bridge, Firth of Forth, Scotland; completed 1890.

The Quebec bridge which collapsed August 29th 1907,

The unsightly structure new proposed by the Canadian government for the Quebec bridge.

#### THE DESIGN FOR THE NEW QUEBEC BRIDGE

management of the work was so badly organized, that the blame could not be definitely fixed in any one quarter, and in the end the Canadian government had to assume the whole money loss. The work was cern culty! taken over by that government, and it was declided to rebuild the stravium. For this purpose a commission of these engineers was appointed, and it was publicly amounted that the new bridge would be the finest and divergest stravium of the kind ever

The Commission was appointed about eighteen months ago. In the interior the preparation of the plans has cost about 1310 000, and as the result of its eighteen months work the Commission has produced to very commonplace design, howevith illustrated, re, aarding which there is a general professional opinion that both structurally and esthetically it is distinctly interior to the Porth Bridge, which was completed nearly twelly years ago.

If the bridge is built according to the proposed plans, it will not only be of inferior merit, considered from the bridge contineers standpoint, but will also be the ugliest bridge of monumental proportions among those bitherto proposed or built. It presents the speakness of a monotonous menho of triangles and straight lines. From shutment to abuttment there is not one graceful line in the whole structure, not the

suspension bridge could be built more cheaply, more quitkly and with lear size of failure during evention On the other hand, if a bridge of the cantilever type is selected, it should be one of the first duties of the Board to see that one of the contributory causes to the wakeness of the bridge that failed, namely, its desired, that the samely, its selected, it should be one of the transition of the section of the section

dare run faster than 35 miles an, hour The vibrations, due to the narrow witht would become excesive, and at faster speeds would create danger of exrationest. On the other hand, the advantages of great width in proportion to length are shown by the fact that the fast and heavy express trains in the north that the fast and heavy express trains in the hoofing street, and the second of the street of the should nature over the Forth Fridge at their full speed of from 16 to 60 miles an hour

Another amount in the specifications upon which the are invited which is pussing segments and contractors is that the maximum height of the severy R really would some as though the board of sugments who draw up the appellentiams were desirons to put weight into the new bridge merely for the sake of having it there, for it well understood that the areas of the real three to the sake of having it there, for it well understood that the areas for the sake of having it there are not to the sake of having it there are not the sake of having it there are not the sake of having it the sake of having it there are not the sake of having it is sake the sake of having it is all fined, and it is the quicked for the parts Bridge in 185 fact, and it is the Quade for the forms and fine it.

In the answer to Query 12,165, by an inadver-tence we divided the shims by the rolls to obtain the current, Instead of dividing the volts by the chanc. Of course verryone would as immediately than this was a silly and not an ortror of Ignorance. We thank our friends for their rieses which of our Notice and Queries

## A HOVEL AMERICAN MOSOPLANE.

(Continued from page 1 | 6) culated through the bearings and the crankshaft by a gear-driven pump A narrow Livingston radiator is mounted in narrow Livingston radiator is mounted in front of the motor, a short distance back of the center of the plane. Two torpedo-shaped gasoline tanks connect the two sets of front and rear uprights at the

sets of front and vear upragnts at the center of the machine. The single surface of this monoplane consists of seven sections—a central one and three on each side. Both the spars forming the front edge and the rear spar, forming the front edge and the rear spar. On these in advance of the rear edge, are divided on such side of the center section into three f-foot lengths. These spars are jointed together by sheet steel conclusion and are securely held in position by cables, forming a double post in treas and passing over the light goals to cables are attached to drill. The company of the various sections. These ribs are trussed by an inverted rib and drill red

ties. The formed of Baldwin's val formed of Baldwirk's valenaised Japaneses antileproof material, and which is colored black according to the funcy of Mc. Pfitners, is located on in sections and is hold to the ribs by feather bone and tacks. A section 30 inches long is left out at each end of the plane. This section is to be courseled by the silicity wing tip. These wings tips or equalitaries, and the section is to be controlled by the silicity of the section in the section of the section is the section of the sect which are 30 inches wide by 5 feet deep, have the sance curvature as the main sur-face, and are each formed of three ribs connecting a front and rear edge, which slide in a suitable track made of steel tube rails extending the whole length of the outer section of each wing, i. e., 5 feet, and allowing the sliding tip a 30-lach invasal by their nautral position those travel. In their neutral position these

wing tips extend 15 inches beyond the end of the wing proper When one is slid out the full distance (30 inches) beyoud the end of the wing, the other is drawn in beneath the end of the opposite drawn in beneath the end of the opposite wing. These tips are connected by a long cable, which passes over pulleys and is wound around the control wheel, so that when the wheel is turned to the right when the whose is turned to the right the left wing tip is fully extended, and vice verse. As the area of each wing tip is 12% square feet, when one is fully ex-tended and the other withdrawn, there is tended and the other withdrawn, there is a difference in lift at the end of the wings of about 50 pounds at 40 miles an hour, at which speed the machine lifts about 4 pounds to the square foot.

The horisontal rudder in front and the

tall at the roar are mounted on two trussed rods extending about 14 feet in front of and 10 feet behind the main plane The horizontal rudder consists of front of and 10 feet behind the main plane. The horizontal rudder consists of a main beam about a third of the way from the front to the rear edge, upon which the ribs are mounted. These ribs are connected together by a light front edge of wood and at the rear by a wire cable. The rudder is balanced. At its right end is a double vertical lover, which is connected by wires to a similar lever on the transverse shaft at the base of the on the transverse shaft at the base of the control column. The latter lever can be seen in the three-quarter front view of the machine. A forward and backward movement of the control wheel depresses or raises the borisontal rudder. The veritari rudder is connected to the control wheel fin such a way that when the wheel is notice to the control wheel in such a way that when the wheel is rotated about its vertical axis the rud der is set to turn the monoplane. The motion is the same as that used in steer ing a bicycle The vertical shaft of the ing in the supporting bracket, the trans-verse steering lever being just below this bearing Cables connect the ends of this lever to a similar one on the vertical rud der in order that the longth of these cables may remain the same during the fore-and-aft movement of the control wheel, the bracket at the base of the con trol column is arched so that the ends of the steering lever just mentioned are in the center line of motion. The cable that operates the wing tipe, and which is wound around the circumference of the steering wheel in a groove, is led by means of pulleys through the he of the control column It leave of the control column. It leaves the pair, lays in the control column. It leaves the pair lays in the consist line of motion, so that its tension is in no way affected by the interest columns of the control wheel. The threatist leaves for the carburdour is cable passes through the locations as cable passes through the location of the carburdour is and over pulleys to the carburdour a systic button for short-drevuling the magnato is also monated on one of the model of the controlling mechanism is extremely singulated with the controlling mechanism is extremely single and doubties will be widely used in It leaves the pulpie and doubtiess will be widely used in the future, as we understand it is the in-ventor's intention to give it to the public and not to patent it.

All the woodwork used in this construo-

All the woodwork used in the construc-tion of this monoplane is of spruce. The spars and strute are solid and have their front and rear edges tapeced, while the ribe are laminated With the exception of the motor, radiator, said grost cables, the whole machine is disalogh black and (Concluded on page 15L).

MUNN & COMPANY, Inc.

(Concluded from page 150) makes a very striking appearance Pfitzner has already made a number of short flights in which he was able to get off the show-covered ground within a distance of about 100 feet. The machine is very speedy and so far has shown ex-cellent stability. On one occasion it is very special and so far has sinon ex-cellent stability. On one occasion it whirled completely around when the ver-tical render was turned too sharply and yet. In doing this it kept a level keel and was not damaged. The running ear has been broken and will have to be much what stronger, but otherwise the ma thine has shown itself to be very strong ly and well constructed. The novel slid-ing wing tips used on this machine are agile different from the system of warp-ing the planes used by the Wright brothers, and from the first trial lights at least they appear to be fairly effective. Not until more extended flights have been made however can their true value b determined

## SHORELESS POWDER

(Continued from page 151) dry in some ways—the cotton being di-gested in centrifugal wringers of a sort gested in contribusal wringers of a sort akin to those in which clothes are wash ed. The atmospher is intensity acrid and the stranger coughs in the biting air, to which the throats of the operatives seem to be indifferent. When the cotton seem to be indirer at. When the cotton has soaked sufficiently, it shows signs of heating by cultiting a dense brownish smoke. It is then tumbled into vats of running water, and there, 'drowned before leing wrung out in another mechani cal wringer The cotton, before inno-cent has become an explosive in fact, is guncotion or pyro-cellulose its subse-quent stability and value as a propellant now depend upon the thoroughness with which all traces of the transforming acid

by Peel. T O'CONOR BLOAM!

As incompared theory of the heat torknow Board in the control of the Next the stewed cotton is taken to the pulping house, where it is pulped and poached like the materials used in paper making. The water is changed often, making The water is changed one-and after twenty or thirty hours work-ing, the "pyro is quite freed of the last trace of acid. These various operation, do not undo the nitrating. The chemido not undo the nitrating. The chemicat metamorphosus accomplished in the cotton by the acid is permanent, and the boiling and washings serve only to re-move spent and unabsorbed acid. The slimy pulp is now put through a "wet machine" coming from the rollers in flakes containing about 40 per cent of moisture. Thence it goes to the dehyd rating house, where all but a small per centage of the moisture is extracted by successive applications of pressure and, finally, by the use of alcohol which drives the dampness before it leaving just enough of the spirits behind to form the enough of the spirits behind to form the needful solvent when either is added. The ether is poured in and the stuff is ground and niked in a mechanical kneeder After half an hour's working the material resembles damp cracker crumbs Chuncally the pro is now solvent and has undergon unother change, requiring only the proper amount of pressure to produce homogeneity. The "colloid" for such it is is then pressed "coiloid" for such it is is then pressed into cakes wighing fifty pounds, which suggest soft rubber and are dully reson ant. The stuff is no longer white but looks like syrupy maple sugar. The amber-colored cakes are then subjected to a heavy pressure and the plastic stuff forced through steel collanders, whence

it issues in cords like solid macaroni Again, for the sake of more perfect union these cords are pressed into a single com-pact cake, and then the plastic mass is (Continued on page 152)

weapon.

The actual fashioning of the powder is now complete; but there are still things to be done before it is fit for issue shows to because over its its for issue the second of the by actual firing, and mixed with grains of other groups to secure a desired average, the powder is put up in air-tight tanks ready for issue. The object of careful sealing is to arrest the escape of the remaining solvent, which acts as a determinant and prevents the explosive from becoming too mick in fits hunning, thus coming toe quick in its burning, thus serving to check the development of sud-den and dangerously high pressures in

den ann mangerouse, the gun.
Smokeless powder can be dampened, and, provided it does not mildew, is as good as ever if properly dried again. After a nowder becomes eight or ten years the powder becomes unstable and even crumbles, but it can be sent back to the factory, be rework the semi back to the factory, be reworked, and turned out once more a good explosive at an outlay of only one-fourth of its original cost. This is proof of the Indestructible nature of its base-pure cellules—which however defect the canning of the chemist and holds secret the ways in which sampling of of the chemist and molecules the campaign of the chemist and molecules the ways in which amanine, oil, and receive the ways in which amanine, oil, and the work work mysterious differences in the minute calls of each elicitat filament. The cotton from Georgia does not make the aman powder as that from Alabama, and the blooms of Tennesses frew us the best and the blooms of Tennesses frew us the best proposed to a perfect and uniform powder. The proposed is the second proposed to a perfect and uniform powder. But he was a perfect with the minute and a sample of each lot is kept under continual independent of each lot is kept under continual independent of each lot is kept under continual index of each lot is lease, he was a language of a vital and the second index of the weards of the wayon. MORBING AND EVENING STARS FOR 1910.

(Continued from page 146) ity in its orbit is 6 miles a second, and the period is 29 46 years. Saturn's position is indicated at intervals of sixty

days.

The plane of the crist of Uranus is in clined at an angle of 0.77 deg to the celiptic, which is less than that of any of the other planets. The mean velocity of the other plants. The man winsty is 4 2 miles per second at a mean distance of 1.7319 million miles. The centry of the orbit is 826 million miles from the sun. The plant completes its revolution in 84 of years, and its position is shown at intervals of 120 days. Neutron's orbit. is inclined at an angle of 18 deg withstanding the planet's great distance the linear eccentricity is only twenty five million miles The orbit velocity is 3.4 miles per second, and the mean distance is 2,7916 million miles. The revolution is accomplished in 164.73 years, and the planet's position is shown at intervals of 180 days.

Neptunes distance from the sun is a very little over thirty times that of the earth  $\left(\frac{2.791}{92.9} - 30.055\right)$  The square

root of the cube of this number gives the root of the cube of this number gives the period, which is 16478 years. This illus-trates Keplers third law, vir. The squares of the periods of the planets are proportional to the cubes of their mean distances from the sun. By simular com-putations the relations between the peri ods and mean distances of all the planets may be shown to be those which are here given

NOW TO DETFEMENT THE MORNING AND

A planet whose orbit is within the carib's orbit is morning star between inferior and superior conjunctions and evening star between superior and in ferior conjunctions Prior to conjunction a planet outside the carth's orbit is even ing star, after conjunction it is morning star It should be noted however when a planet is near conjunction, it is not far enough away from the sun for observation. The longest arrows indicate the directions in which the major planets are seen at opposition, the shortest ar rows the directions in which they would be seen at conjunction if the sun were out of the way. At the date of opposition a night, and is therefore both morning and ing star

If the page he turned about one-quar it the page be turned about one-quar-ter of the way around so that the earth in Plot I on January 8th (the date of the opposition of Neptune) is between the reader and the sun the positions of all the terrestrial planets on this day may be seen without turning the head. The earth rotates in the direction of the ar earth rotates in the direction of the ar row At sunrise an observer emerges from the shadow area at sumer he can term if All plantes which in the plot are on the right rise before the sun and are morning stars, those on the left the after the sun, and are overling stars. On Janu ary 5th Neptuces is above the horizon morning and evening stars. Confinetion of Uranus with the sun occurs on the 11th Previous to this date Uranus is evening star, and subsequently morning evening star, and subsequently morning star On January 7th Saturn is at quad

rature, and is evening star On January 4th Jupiter is at quadrature, and is morn-ing star On January 17th Mars is at quadrature, and is evening star Or January 25th Mercury reaches inferior conjunction Before conjunction the planet is evening star and after conjunc planct is evening star and after conjunc-tion it is morning star. During the month of January Vegus is evening star. The planet is at inferior conjunction on February 12th, and after this date is morning star. The table gives the dates of conjunc-(Concluded on page 154)

#### THE DESIGN FOR THE NEW QUEEN BRIDGE.

REIDER.

(Concluded from page 148)
low height of 290 feet necessarily increases the weight of a cantilever, and if used for the towers of a suspension bridge used for the towers of a suspension bridge would result in a flat extensity, requiring unusually heavy and expensive cables and anchorages. The great height of the tow-ers and trusses in the Forth Bridge has rtant bearing upon its rigidity under fast trains

The effect of low height and narrow width in raising the weights is shown in the fart that the amount of steel to be the fart that the amount of steel to be put into the Queber Bridge in a length of 2,800 feet is estimated at over 66,000 tons. The total amount of steel in the Forth Bridge in a length of 5,300 feet is Forth Bridge in a length of 5,300 feet is 53,000 tons in other words, the narrow Queboc structure would require the en-ormous average amount of 24 tons of steel (about half of which moreover is nickel steel) per lineal foot, whereas the wide and rigid Forth Bridge required aff average of only 10 tons of carbon steel per lineal foot It is true that the train leads assumed for the Queber Bridge are about three times as heavy, but it is well understood that the weight of ste bridge of great span does not increase in anything like the same proportion as the live load

#### NEW OVERHEAD ELECTRICAL COMPTROS. TION ON THE NEW HAVEN BAILBOAD.

(Continued from page 140) building, through the Westinghouse Com-pany, an experimental freight locomotive, preparatory to operating its whole service, freight and passenger, from New ice, freight and passenger, from New York to New Haven, a distance of between seventy and eighty miles, entirely by electric power

At the time of its construction the

present twenty three miles of electrified line between Woodlawn and Glendale, present twenty three miles of electrified into between Woodinary and Glandale, the most couragous and costly experimental works ever understaken in the broad field of electricity. The story of the unparalleled difficulties with which the company had to contend in developmental works and at the same time howely and at the same time howely make the profession of the world has been told from time to time and in considerable detail in these columns. Today this electric same is running with the requirity of a that the delays through breaken or the electrical locomotives are shown by the statistics of operation to a 100, per cont loss than were the delays made open.

out less than were the delays under open-ation by steam loomodifue.

The experience gained during the past two or three years has revealed to the sugmorrs some features in which the elec-tric plant is capable of improvements. Per-ticularly is this true of the everhead (Ossofeded on page 485.)

(Concluded from page 15) work, which in the existing line is of a massive and decidedly coatly type of construction. In addition to its expensive nature, the present overhead line was found to have unnecessary rigidity, and it was decided that before extending the work to New Haven it would be wise to ilid a fulle of experimental line, dying the improvements suggested by pouting the improvements suggested by past experience. We present two photo-graphs and a diagram which clearly illu-trate the character of the new work. In the old construction the line is carried upon massive steel bridges, spaced 300 feet apart, each bridge consisting of a pair of columns supporting a lattice trush which spans the four tracks. Each trol ley wire is hung from a pair of steel 'incasenger' cables by means of a series of triangles, the messengers being huns in a true catenary and fastened to insula tors attached to the top of the latticed The trolky wire, which is main tained in a horizontal position passes betained in a northootal position passes below the supporting trusses. The whole
of this system—messenger cables, tri
angles, and trolley wires—is charged with
current at the high potential of 11 900

was made not only to lighten the con was made not only to ingiten the con-struction, but also to provide one whose appearance would be lighter and more graceful. Furthermore, the cables and wiring have been so arranged that the main carrying cables and the main pipe hangers are not charged, and the only live portion of the work is the catenary trolley, and contact wires By reference to the engravings it will

be seen that the place of the massive bridges is taken by a pair of relatively slender tapering, columns, which are curved inwardly until they terminal above the centers of the outside tracks. To hold the columns in a vertical position and hold the columns in a vertical position and prevent their sagging under the load of the cables a length of steel pipe trussed with wire, is introduced between the op-posite incurving ends of the columns. The duty of carrying the wiring falls upon two 11, inch steel wire cables which are secured at the ends of the latticed columus, and extend continuously through out the whole line 13 pending from these cables at intervals of 100 feet are a which is hung from the cables above by which is suight rout the curies more upon two pairs of supports formed of 1½ inch pipe. All of this construction thus far described, columns, main cables and main pipe hangers, is at all times dead none of the current bring allowed at any time to pass through it—a feature of the greatest importance when it comes to the question of making quick repairs to the line, or of adjusting the set of the cables Attached below the transverse horizontal members of the pipe hanger are four por celain insulators, which are adjusted so as to lie vertically above the four tracks, and this feature of adjustment is one of the great improvements of the new over the great improvements of the new over the old line Upon the insulators are strung the four steel track messenger catenaries, below whith, carried on short vertical pipe hangers of graduated langths, is the copper trolley wire. An 'nch or two below the trolley wire and supported theoretem by steel clips, is the steel contact wire, against the under side of which the collector shoes of the locomo tives bear with an upward pressure of about 25 pounds. The method of attachabout 20 pounds. The method of attach-ing the contact wire to the trolley wire at points intermediate with the points at which the trolley wire is itself suspended, provides a system of equalization which gives to the system an even faxibility throughout its whole length, and insures a continuous contact and a consequent freedom from sparking

The management of the electrical zone of the New Haven Ratiroad Company and ers are to be congratulated in Jis engineers are to be congratulated in having made such a marked improve-ment, both from the constructive and esthetic standpoints, over the existing line between Stamford and New York

come from a faulty fire. How does your fire burn? Is it sometimes hot and sometimes not? Does it come up very fist and then lose its heat? Is the red flunc edged with blue? Is the coke formed dark-colored and crumbing? Do you have trouble getting good solid welds? Then-You're Using the Wrong Coal. You SHOULD USE

# WEBSTER SMITHING COAL

Try these simple tests on the coal you are using:

1 Crack open several pieces the size of your fast. If little white sectes or brown deposits upon a between the layers, they are sulphur. Its shad for from a steel and absolutely pracents good welds. Webster Smithing Cold is practically free from sulphur.

2 -Look at the coke formed around the edge of the fire. If it is dark and crambly the coal contains much dirt. Webster Smithing Coal forms a claim hard gray coke, of even grain, which when burned over, makes a hot site of the property of the control of the companies.

3- A blue edged flume indicates sulphur. Webster Smithing Coal, being practically free from sulphur makes a pure red and yellow flume.

4-1 ook closely at your coal-pile and see how many pieces of dull gray slit vou cut pick out part from the surface of the pile. Slite is not coal it will not burn and it keeps the coal with which it is mixed from burning freely. Webster Smithing Coal contains no slate. It is pure Coal

5—If your fire is hot in spots, or for a short time, and then drops out? It coal is low in hert efficiency—is not adapted to smithing Welster Smithing Coal maintains a high clear heat for a remarkably long time, because it is all jurie heat-grying coal, specially selected and specially prepared for annithing

It pays to use Webster Smithing Coal. Saves dollars on coal bills. Avoids fire troubles and welding troubles. Improves the quality and quickness of work

Webster Smithing Coal is all mined from one basin in Cambria County, Pennsylvania, right in the heart of the region noted for high grade sinithing coal Sold by local coal dealers anywhere in the United States and Canada or shapped direct in bags, in bulk or car load lots. #### SECRETARY MEYER'S PLAN FOR THE RECREAMIZATION OF THE HAVY

IIA1 one of the first acts of Mr Meyer on sunning the extremely difficult and respon sible position of Becretary of the Navy, would b to make a thorough investigation of con-ditions with a view to placing that very complicated department upon a more practicable working basis was inevitable as everyone must have foreseen who is familiar with the excellent work of reorganization which he achieved while holding the position of Post master the noral

changes introduced by Mr Mever are nece marily supplemental to the work of his predecessor Newberry who had formulated and put into effect a system of consolidation which, in the brief period a system of consolidation which, in the brief period of its operation had shown excellent results Mr. Mever has assured us that the changes which he has instituted in the Newberry plan have been made not for the purpose of reversing but rather of smpliffying the work of consolidation inaugurated by his prede The essential changes involved in Mr plan are summarized under the following heads

- pian are aummarized under the following nears

  (1) The provision of four responsible advisors (of
  the Secretary) on subjects within the groups into
  which duties of the Department logically fall

  (2) The grouping of the Dureaus into two divisions
- of material and personnel according to the nature of
- (3) The establishment of a Division of Operations
- (4) The establishment of a comprehensive inspetion system of a permanent organization whose officers shall be periodically changed who will come mainly from the active fleet and be conversant with the latest slips and the modern methods of drill and organi xetion
- (5) The establishment of a modern and efficient cost keeping system in the Navy Department and at
- navy yards. he separation of navy sard work into the two natural divisions of bull and machinery
- (7) He intends to require that commandants and toptains of pards for navy vards shall be selected for their knowledge and experience and that their tonure of office shall be long enough to insure continuous administrative policy

The Schatter Augustan has before it the printed record of the hearing of the Secretary and various Bureau chiefs before the House Naval Committee apnursus times score the House Vaval Committee ap-pointed to consider the proposed reorganization, and, after giving the same a most careful reading, we have come to the conclusion that with one very serious exception, the measures proposed by Secretary Meyer ar well adapted to promote that consolidation which Mr Newberry began and which the present Secretary he was not you and whom the present secretary is endeavoring to place upon a lasting workable basis. The appointment of four addes, independent of the Bureaus whose duties will be to inform and advise the Suretary on matters coming under the four gen eral heads is an excellent arrangement the need for which had been keenly felt by previous secretaries.

The Aides for Operations of the Fleet, for Personnel. and for Inspections are to be line officers. The ques-tion as to whether the Aide for Material should be chosen from the line or staff is left open. We are decidedly of the opinion that in seeking for advice on decided in of the opinion that in seeking for advice on the question of maintrial that is abige, sendors many works of the Streetery should have a bit and to be the property of the properties of the properties of the py training and experience is been qualified to advice upon these subjects. A proportion of three line officers to one state officers among the allew would give a fuir representation of both branches of the service, and would not the Serveirry adequately in touch with the

The feature of Secretary Meyers plan which we consider to be open to very grave question is the proconsider to be open to very grave question is the pro-posal to sentrate the navy yeard work into two distaines of hoil and machinery, with a separate and indepen-dent manager for each for the change involves the electron of the navy pards, namely he securing of efficiency, and the avoidance of contraston and delay, by planing the shole of the work affecting the con-struction of the ship in shares or the contrast of early of the sole of the very many than the con-trast manager of the yard. Mr. Meyer recognizes that a navy yard is a military establishment and must be under military questioned but this condition was

that a new yard is a ministry entorshalled and thus be under military government but this condition was not under the Newberry plan by placing at the head of the yard a commandant who is always a line officer et the yard a commandant who is sivenya a line officer of high rank Under him came the manager, a naval constructor whose executive powers were recognized ac covering not the military, but the industrial side of the work. In view of this distinction, we fall to see how the management of the yard as to lise non rillitary and purely industrial features by a staff officer of the management of the yard as to lise nonsee now the management of the yaru as to us more initiative and purely industrial features by a state officer of the naval construction corps is, in any possible sense a violation of that law of Congress, as cording to which a staff officer cannot exercise milit iary command over any other than members of his trea going) officers of the Engineering Corps, who were temporarily assigned to the steam engineer ing department at the navy yard were subject to the haval constructor manager, purely in the industrial and not in the military sense

If it is advisable for economy and efficiency and the consensus of evidence is overwhelming on this point, that the navy yards should be under a single indusmanagement and that this management should rest in the naval construction corps, and if under such an arrangement any legal question is involved as to the right of the constructor-manager to exercise non military authority over engineer officers of the line who may be temporarily assigned to duty at the yard then the sonner the law is modified the better for the interests of the navy, and of the American people as

If it be asked why both hull and machinery sho be placed under the control of a single head, and that isad the mayal constructor we reply that the bull and the machiner, are marely subdivisions of one organic s hole and that the two are so greatly interdepende an to make it necessary that their design, construction and submount result be under the management of a single corps, who are qualified for the work by train ing, knowledge and practical experience You. we the statement without any fear of successful contradiction, that the one body of men who combine the necessary knowledge of naval architecture and steam and electrical engineering to qualify them for the oversight of the construction and repair both of the hull and the markingry is the corps of naval con structors Unfortunately, much of the evidence which las been given before the committee has been directed to proving that the naval constructor is ignorant of steam and electrical engineering and therefore not qualified to take charge of the shops devoted to these branches at the many yards. That nothing is furthe from the truth is shown by the following consideration of their training and experience

In the first place the naval constructors are the pick of the Naval Academy graduates. They are selected from the highest numbers in their class and, as a have been taken from the first two or three purking the selection in addition to their academic standing careful consideration is made of their standing carried venisideration is made of their gen-rial aptitude for the service as shown during their three or four years at sea, of their general officer like qualities, and of their aptitude for the handling of men, and for general administration. The principle of selection is the same as is followed in the case of that other highly specialized and most efficient body of professional men, the corps of orginares of the After their education as line officers at ses Bring the constr Institute of Technology a post-graduate course in naval construction, which is the most thorough of any in the world

Furthermore (and we cannot too strongly insist that the impression that the naval constructor is fied steam engineer is absolutely erroneous) the course no steam regimer is associately erroneous) the course as the Massachusett institute of Technology involves also thorough instruction in steam and electrical regimening during which the prospective constructura are given a course of practical training in the lacking shope and laboratories of the institution. The life work of the navel constructor will be done

on shore and mainly at the various pavy yards, and on store and mainly at the various may yards, and by virtue of his long residence at these yards, or as inspector at the various private shipbuilting yards, he achieves an over-increasing and immensely valuable knowledge of the operation of these great industrial points. Future promotion and distinction for him is aiming these lines. There is every incentive for him to become thoroughly predicted.

Withighe line officer, however, into whose hands Mr. Meyer's plan would commit the construction of of the large and elaborate plants at the navy yards where this work is done, the case is entirely different. After his four years' course at Annapolis, the pros-lective naval engineer goes to sea with the expectation of spending practically all of his time affect, and, naturally, his sympathies, interests, and above all his ambitions, will be connected with sea duty. An as-signment for service ashore is merely a break in the routine of his chosen life work. If the line officer be an engineer officer, he will enlarge at sea his knowledge of the care and operation of a ship a machinery, but since by far the greater part of his time is spent his opportunities for becoming acquainted with the complicated and difficult work of managing such large industrial concerns as the steam machinery shops of the navy yards are, in the nature of things, very itr d His work is to run not to build, the engines, just as it is the work of the captain of the ship and not to build the hull.

on when the line officer is ashore, his interes Eyen when the line officer is assore, his interests and future sims are still upon the sea, and, as a rule, he is only too glad when the next assignment for sea, duty comes. Proof of this is found in the fact that during the past six years there have been at our sever kading naval yards, no less than 29 commandants and 41 captains of the yard Evidently, the sea-going office t too quickly got back to his natural sph

If there were available at the preof engineering officers who, like the naval constructors, bad been specially trained for shore duty in the man-agement of the machinery shops, etc. at the navy yards we would have more hope of the success of this siar part of Mr Meyer's plan, but outside of a few of the older engineers, trained under the system which obtained before amalgamation no such body of men is available. Furthermore, it is our conviction that were such a body existent it would still make for economy and efficiency, if both hull and machinery were placed under the single manag

That part of the Newberry plan which affected the ant part of the Newberry pian which are tell the navy yards was giving very promising results at the time Mr Mojer took office. We have little doubt that his determination to separate hull and machinery was poverned largely by certain alleged instances of facepacity of the naval constructors in their man Secretary, most of them over the signature of the Engineer in Chief The testimony before the House Naval Committee now before us however shows that a subsequent examination of these reported cases has clicited from the commandants of the various yards (all of them line officers) a complete disproval of the charges as made -a very gratifying vindication of the work of the naval constructors in this particular rework of the naval constructors in this particular re-gard. We cannot but feel that with this later evi-dence before him, the Bocretary will be disposed to reconsider that part of his otherwise excellent reforms, which proposes to separate hull and machinery and that he will allow the Newberry plan of a single management sufficient time to further demonstrate the conomy and all round efficiency of which it gave in the few months of its operation such great promise

#### LECTROLYTIC REMOVAL OF GREASE.

N cleerolytic method of removing grease from objects has been introduced in Germany Grease can be rapidly removed from metallic objects by employing it as a cathods in a hot solution of potant or woods by it was supposed that the alkall metals set free at the exthode transformed the fatty matter into soap, but Barth has now shown that substances which cannot be saponified, such as machine oil, parafine oil and parafine, are such as machine oil, paraffine oil and paramen, removed very quickly by the current, and be explains this fact by mechanical action caused by hubbles this fact by mechanical action caused by hubbles. is produced only when the fatty matter is liquid TI is produced only when the faity matter is liquid it is the temperature of the bath is too low so that the areas is considered. The rumoral is very also and it is not also that the areas is considered. The rumoral is very also and it is remarked solution of carbonate of potash bested between 85 and 100 deg. C. As the snode he uses sheet iron carbon pieces When a place of sheet iron rovered with oil or paradine is disputed into this bath it remains overeved with oil ten minutes after immersion when the current does not flow, but upon sending the current all traces of oil disappear in a few minutes.

To permit two steamers to pass from the Wisconsin River to the Mississippi River, near Prairis du Chieu, Wia, a railway bridge on the Chicago, Buritagio, and Quinoy Railway was raised by breakfows crance a few wocks ago There is no navigation on the Wis-conain River, but the two steamers were sent down to enter service on another routs. The railway cross the river near its mouth, and a \$5-foot span was red about 6 feet to clear the weamers' funnels.

This how for the transcending contribution had been handed to both by four Highes on lockalf of the people of New York, as a testimontal of appreciation of his a histories in the finding the North Pole, and the Mercposition Opera House was revoked with people who had come to lake part in what the featering Civil Forum called a national restinontal?

There is a gaseous clement discovered in the atmosphere by Ramsay which is remarkable for its chemical inertress but though destitute of chemical properties it possesses a very curious physical property which was discovered by J. Norman Collic. When a scaled glass discovered by J Norman Collic When a scaled glass-tube containing mercury in an atmosphere of mean is shaken it becomes strongly hund nous Similar effects are obtained when other gases are substituted for neon but the light emitted by neon in these conditions is especially bright. If the shaking is repeated at intervals during two or three hours, the intensity of the light diminishes for a time and thereafter remains constant. The original lumi ordly can be restore d by passing an electric discharge through the tube. If one end of the tube is heated to 750 dcg F while the other end is cooled by immer sion in liquid air and the tube is then allowed to reordinary atmospheric temperature part which has been heated glows much more brightly than before. The luminosity is also greatly in massed by substituting a tube of fused quartz for the glass G Claude is endeavoring to utilize this remark able property of neon as a source of light and claims to have constructed neon lamps of an efficiency equal to about 1 watt per candle power.

# DID GREAT BRITAIN HAVE THE FIRST "DREADNOUGHT"?

THE "ROYAL SOVEREIGN" OF 1862

BY PERCIVAL A. HISLAM

The SCIPMITTE AMERICAN for November 20th, 1909, contained a description by Mr William Boernin Westmore of the U S S Roanoke' a converted steam frignic, which he claimed to have been the original frighte, which he claimed to may now not occurred principly of the Drandmught. The date of the conversion of the Reamon's from the frighte into the hirrestructed from the was 1853 hat England, the hirrhighes of the twentieth century Drandmught, here a similar instance to the Reamon's," but which dates from the previous year—1862

The 100 all fovereign as this ship was named, was built as a three-level sating ship of 3.144 tons and 120 guns and in 1880 had been fitted with engines of 800 horse-power. The sides of the 'Royal Sorresign' effer convenion were composed of three feet of solid lumber strengthened internally with disponal from bands and totaled externally to some distance before he asterline with 5.5 lish reliable errane plates One has he can be such as the contract of the cast of the side of the si The Royal Sovereign as this ship was nam

sides of the ship the deck shaped upward to the ourse circumference of the turrets, which thus appeared like circular forts on the apex of a glacis. The following description is taken from a contem-porary account in the London Times newspaper "Stop-ping on the Royal Sovereign's upper deck, we find that her light iron bulwarks, 3 feet 6 inches in depth are thrown down outward on hinged stanchions. On the creat of the deck stand the four turrets and pilot house, funnel casing, hatchways, and ventilating shaft The foremost turret standing five feet above the deck, The formost turret standing five feet above the deck, has its top covered by a grating, and is surrounded by a handrail, and thus affords a deck promenade for the officer of the waith or lockout man 'thu single-gun furrets are 4 feet a linches above the deck'.

It was claimed at the time that the method of mount ing and working the guns in the "Royal Sovereign" was superior to anything which had then been applied in any American turret ship in American design turret reated upon the upper deck, and was thus liable to many disablement, but in the English vessel the base of the turret was on the lower dock, and the cita del was therefore much less likely to be disabled by a hit. The American method resulted in the turnet being nine fret above the dock while in the "Royal Bovereign" only five feet or four foct three inches, as the case might be, was exposed to the enemys fire. Further, the latter ships turrets could be worked by rack and pinios inside the turret, by the same method son bars, as well as by steam

It will be seen that the "Royal Sovereign" bad four turrets—one more than the Roanoke", but she had one gun less, for while the forement contained two guns, the others had only one each. All the turrets were mounted on the center line of the ship, and the guns were muzzle loaders of 12% tone firing a 300-

The original spe d of the 'Royal So 12.25 knots, but after conversion this fell to 11, a difference which was fully accounted for by the in-creased immersion of three feet. Her freeboard re-

Converted British three-decker "Royal Se changed to an all-big-gun battleship in 1862 WAS THIS THE PIRST "DREADWOUGHT"!

mained at seven feet after conversion. The cost of the work was \$699.900

The "Royal Sovereign," besides having been, at a rate, one of the prototypes of the modern. Dread nought, is interesting as having been the first vessel in which the turret principles of Capi Cowper Coles were put into practice. The first vessel actually built in England embodying those principles was the "Captain," an ironclad of 4,272 tons, which capsised in the Bay of Biscay on September 6th, 1870

say of 1860ay on september etc., 1870
According to contemporary accounts, the speed of the
Roanoke' was only 5 knots 'This is inferior to the
Royal Sovereigns' speed by 6 knots The latter
temel again, had four turrets to the 'Roanoke's' three, both ships had 54 inches of side armor in a olled plate although up till then most American ships

had been armored on the inferior laminated system, both ships were practically mastless, for the three poles of the "Royal Sovereign" reached only just above the top of the funnel In freeboard there was little e between the two, while in the meth placing the turrets the British ship was decidedly

muon, therefore, as we owe to America in the de-velopment of modern navies, and more especially, per-haps, in the introduction of norm mavigation and in the correct placing of turrets in modern hattiships, it think it must be admitted that Orest Britain was, the first to possess a prototype of the modern "Dynad-mought."

nought."

I have been unable to procure a picture of the "Royal Sovereign" for reproduction, but the accompanying elevation and plan will convey an idea of the

purpling elevation and plan will convey an idea of the appearance of the skip.

It may be mentioned that Russia kunched in 1878 the "Admiral Lanared", a three-in-tracted tronclad of 2,776 tons, very similar in general design to the "Ros-noke." She carried in each trury two 13½-ton such but it was seen fit later to alter this to one 11-inch for each in view of the diagonal for echolos) arrange-ment adopted in the British "Drusdrought" cruisers of the livewiseld type, it is interesting also to note of the livewiseld type, it is interesting also to note the livewiseld type, it is interesting also to note of which the "Dullio" (1870, Great Britain following with the "United" in 1881, and with four other ships a the "Inflexible" in 1881, and with four other ships a few years later 'The only American examples of this system of mounting were seen in the "Maine" and 'Texas," the first with two 10-inch and the second with one 12-inch gun in each turret.

The arrangement of the turrets in the British

with one 13-inch gun in each turret. The arrangement of the turrets is the British 'Dreadnought' had a prototype in the French 'Advantari Dupers', launched in 1379 'Dis ship had 'devo turrets on the center line and on the same level aft, and a turret on each beam just forward of the fun nels. The guns had a freeboard of 27 feet 5 inches giving them a great command of fire Each turret contained one gun of 135 inches calibre, and if another content-into turret be added forward of the two beam turrets, it will be seen that the arrangement of the 'Dreadscought' is almost exactly reproduced It strangs how often we are controuted with the fact, in reading old books and other records, that there is reading old books and other records, that the

To the untrained eye the work which has hitherto been done on the construction of the Panama Canal necessarily appears more or less confused and chaotic Although over one-half of the excavation has been com-pleted, very little if any of the prism of the canal has been excavated to its finished dimensions, and the

works in the aggregate will probably represent the largest mass of mason; of any kind whatsover hithereto plared in a single engineering work of magnitude it is questionable whether an exception would have to be made seven in the case of some of the famous mason; requeducts built in ancient times, and the

Gatun on the Atlantic side of the Isthmus, one at Pedro Mignel and two at Miraflores on the Parific side, and the great spillines in the center of the Gatun dam for carrying off the surplus waters. All of the locks will be 116 feet wide by 1,000 feet long with a depth over the silis of 45 feet. The three locks at

Note the woodes forms in which the walls are molded Building concrete side wall-Gatun Spillway.

Sand cranes and puckets at Balbon

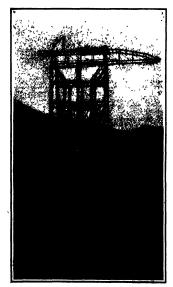

Some few months ago, however, the work of putting in the permanent concrete attructures began, and from new on this great work will begin to take on definite shape and present visual evidence of its massive and permanent character

The masonry works will not only be the largest of their kind ever built the locks and spillways being on a scale of unprecedented proportions, but these

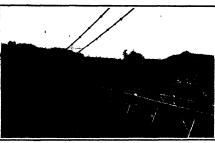

outline of the completed work is therefore irregular and ragged some few months ago, however, the work of putting are found in comparison with difficult by Some few months ago, however, the work of putting draulic works of the character of those on the Panama canal In the accompaning series of photographs, which were recently taken on the lathmus, one is able for the first time to gain some impression of the massive character of the concrete and reinforced-on crete structures the construction of which is now pro-

eding with gratifying rapidity cooding with gratifying rupidity

The concrete work embraces six hugo locks, three at Gatun will form a continuous structure which, with Gatin will form a continuous structure which, with the piers forming the approaches at each end, will have a total length of \$,800 feet, the whole work form-ing one huge monolithic mass of concrete. The Pedro Miguel lock with its piers will be 1800 feet, and the two locks and piers at Miraflores will have a length of 2 800 feet. Into the construction of these locks will onter about 8 000,000 cubic yards of concrete, and of this 800,000 tons will consist of cement. The spillway through the Gatun dam has been cut through a low

Huge emillerer crane for placing concrete at Fedro Mignel locks.

to is brought from twenty miles east of the cane), atoms eranhers at Malhon.

#### Scientific American

all situated at about the center of the dam, and with in the excavation thus formed is now being laid the deep concrete flooring, the massive retaining walls neep contree norms, the measure remaining wans and the piers between which will swing the gates for regulating the hight of the water in that great art! ficial inland sea which will be formed by the dam. It can readily be understood that the economical

and expeditions laving of \$ 000 000 cubb vards of cou and expections laying or shown on cum yarns of on recte in structures of this magnitude called for a spe-cial plant of great size and capacity. At Gaira about 4,000,000 cubic yards of concrete will be employed The crushed stone the sand and the cement for this concrete is handled in the following manner crushed stone comes from Porto

Bello a small handet about 20 miles east of Colon along the At luntic const. The rock is taken from the quarry by steam shovels and sent by gravity to the glant ers, and thence by gravity to the barges in the harbor. From this point it is carried to Cristobal at the Atlantic entrance to the canal and thence the the old French channel, to the docks at Gatun Here it is unloaded into storage bins by giant grab buckets, oper ated from cablessays suspended be iween two sets of towers on either side of the channel

The sand is brought from Nom bre de Dios, about 40 miles along the coast from Colon It is taken from the sand pits by clamabell buckets, loaded into steel barges and taken to Gatun, where it is un loaded by a process similar to that of unloading the crushed rock. The ement is now being shipped from New York At Colon the cement is transferred to harges and taken via the old French channel to Gatun unloaded to the storage yard

and unleaded to the storage yards.
The rock and sand storage piles
have a capacity of about 300 000 cubit yards, while the
coment yard secommodates about 100,000 barrels From these storage buildings, the rock, sand, and ce nt are delivered through valves to charging car running undersually. These cars, which are electrically operated, curry the materials to the concrete mixing machines located nearer the locks' site and discharge it direct to the machines. After the crete is mixed, it is dumped into buckets set on flat cars, and the cars are run to position under the wide cableways spanning the locks' site and from these cableways the buckets filled with concrete are swung to position on the locks under construction

The general principles upon which the plant at the locks on the Pacific side is designed are the same as those employed at Gatun, the mechanical details have

those employed at Uniun, the mechanical details have been varied to meet the local conditions. The latest report of the work, namely, that for De-cember last, shows that during the mouth the total work of excevation amounted to 2,818,862 cubic yards and that the total canal excavation of all kinds amounted to 2,811 681 cubic yards. The material

placed in dams, mainly at the Gatun dam amounted to 340,610 cubic yards, and dur-ing the month 57,285 cubic yards of conte worr built up in place

#### WALLEY'S COMET

Some interesting measures of Halley's comet, made with the micrometer of the Yerkes 40-inch refractor, are published by Prof Barnard in No 605 of the Astronomi cal Journal With this large telescope the comet was quite an easy object, and the measures should be good, but, as Prof Bar-nard suggests, the edges of such a nebulous

body are not easy to set on The measures extend up to Novemi 1909 when the estimated magnitude was about 110, and the comet showed a conden sation of some 7 inches diameter The diam sation of some 7 inting diameter. The diameter of the whole object was 41 inches, and possibly an ill-defined nucleus was seen, but this feature was very doubtful. From September 1. tember 17th to November 14th the mes

diameters reduced to miles ranged from 16,400 to 1 200 miles the mean being 12,800 miles, or about 11/2 times the carth's diameter

At the December 1909 meeting of the Royal Astro nomical Society reported in No 418 of the Observa formical Society reported in No. 418 of the Observa in: the Astronomer Royal amonutes that a photo-traph secured with the Reynolds refector at Helwan, on August 24th shows the comet's image, its position agrees within 0.12s in RA and 1.7 min in declination with the position calculated from the Cowell Crommelin orbit corrected by the Greenwich observa tions Mosars Keeling and Knox Shaw are to be cor gratulated heartily upon securing the first known phoconsupu of the comet. In No. 25 of the Gazette astronomique, Signor Pio Smannelli discusses the probable in countre between the series and the concet's tail in May next. At 10 A. M. (GMT) on May 18th the country lill pass the descending node of its orbit, while the earth will pass the same point circles on the country of the country of the country of the country of the same point circles on the country of the same point circles on the country of the same point circles on the same point circles on the country of the same point circles on the same point circles of the same point circles on the same point circle the earth will pass the same point eighteen hours later for an encounter between the tail and the earth to ror an encounter persons the tast and the earth to take place, it is shown to be necessary that the latter should be 22,100 000 kilometers (13,712,277 miles) long and that its breadth should be such that it extends, from its axis earthward, 400 000 kilometers (2 485,550

# The Occluded Gases in Coal,

Prof S W Parr and Mr Perry Barker of the Uni cluded gases in coal, which is published in a builetin issued by the university. As a result of th work it seems that two active processes are set up immediately upon the liberation of the coal from mainly consisting of marsh gas (CH<sub>1</sub>), the second is an absorption of oxygen There can be little question, moreover, that the alterations proceed simultaneously There are present in the gause from all the samples of fresh drillings, notable quantities of methane, rang ing from 18 per cent to 86 per cent of the vario volumes. At the same time the oxygen present drops columns. At the same time the exygen present drops in a very positive manner, in some cases even reaching the vanishing point. That this transpiration of gases is interdependent and is of the nature of an osmotic exchange can hardly be affirmed as an explanation of

APPARENT PATH OF HALLEY'S COMET FROM JANUARY 6th TO

the phenomenon. On the contrary, there seems to be evidence that the gases operate independently of each other

the three case of samples of marsh gas the exudation of CH, seems to have spent itself in those samples held in laboratory containers for two years. In no case is there evidence of further liberation of this gas, agen with thorough application of the vacuum An evicuation of the gases from two-pear-old samples above so many agents. The completion of this exudation would seem to be reached after two months, though it is well to note that by forcing, as with a vacuum, the two-months-old sample may be made to yield more methane, though in relatively small quan-tities. On the other hand, the avidity of the coal for exygen seems to be pronounced at the very beginning of the exposure of the freshly-mined material, and while there are a number of cases where a certain agree-ment seems to exist between the in-going and the outgoing marsh gas, still there are more cases where the tion of oxygen is pronounced without any evidence of marsh gas being present. In all cases the nitrogen ratio shows a positive diminution of the oxygen from the normal ratio of approximately present it seems fair to conclude, for the present

that there is no necessary connec-tion, at least of a strictly chemical nature, between the exudation of marsh gas and the absorption of

oxygen

Again, the liberation of CH,
while very active in the first few
days after removal of the coal from
the ground, diminishes in amount
quite rapidly till, after the second month, there is very little of this gas in evidence. The activity of the coal for exygen, on the con-trary, seems to be of longer dura-tion. Samples collected June 1st, 1906 were tested in May and June There is marked abo orption of oxygen in the sample after two days' exposure in the flask to nor mal air, while in a second, with five days' exposure, a still fu reduction in the oxygen ratio with-out accompanying evidence, also, it should be noted, of marsh gas, was obtained A marked avidity for oxygen was shown after two years

oxygen was shown after two years from the time of collecting These facts have a direct bearing on the topic of deterioration as sub-stantially defining the limit as to time of that form of alteration

While varying semewhat in different coals, the loss of hydrocarbons for the most part is practically complete at the end of two months. These facts have a bearing also upon the matter of weathering, and indirectly upon the matter of spontaneous combustion. The absorption of oxygen is undoubtedly closely associated with both of these phenomens. The studies upon the weathering processes coincids with these studies in gases, namely, that in all probability this low type of oxidation extends over an indefinite length of time Moreover, while under normal conditions there is ef cted but a very slight exidation and less of fu values, the conditions are favorable, as, for example, for bringing about a very rapid combination with oxy gen upon an increase of temperature

gen upon an increase of temperature
How far this absorption of oxygen is a chemical
reaction, or low combustion resulting in CO, and H,O,
and how far an absorption into the molecular structure and composition of coal must be left for study

#### Dying Pearls

In the Museum of the Louvre in Paris lies a collar of pearls at the point of death. Its death-bed is a plaque of velvet, and it is the large collar that was part of the personal estate of Thiers and once belonged to his wife. It is simply set and has no artistic value, its is simply set and has no artistic vatue, its material value, however is estimated at 480,000 It consists of 145 pearls in three rows, the total weight of which is 3,007 grains, the three largest pearls of the col lar weighing 34, 39, and 51 grains respec-tively. This collar must "die", every day it loses another degree of its luster, and in the course of the present decade it will be-come as the present decade it will become as dingy as a much-worn wreath of

> Why? Because pearls keep their incomparable sheen only when worn by women and come into habitual contact with the

and come into habitual contact with the sentle, soft, and warm skin of the wearer Whee, for instance, Queen Augusta died it was found that her magnifecent strings of parts were likewise in a persistent decline, parts were likewise in a persistent decline, and for the reason, indeed, that for many years and for the reason indeed, that for many years and for the men them on her learn book (which fact was explained by her says but only around the fact was explained by her says but only around the fairly of the men of the fact in sew-water was prescribed for them out of battle in sew-water was prescribed for them ment or cann in secwater was prescribed for corons by experts, and for several months, under obvious necessary precautions, they were sunk into the sea and thus recovered their old luster When, for instance, a collar of pearls is taken from

the neck, where, subject to a temperature of 40 deg C. approximately it has lain for hours, and is laid upon the marble plate of the dresser, which is perhaps only 20 deg. C warm, it feels, so to spe (Concluded as page 172.)

#### MR. RIEDERER'S PROBLEM.

# or of the Burntune Americ.

Your correspondent who replies to my problem cer tainly has not studied the question There is absolutely no doubt as to the possibility of the solution for taking any single number, it is quite evident that the remaining 14 numbers will make 7 pairs, each one of which with the taken numparty, McLi one or which with one it kinds number between the different combination of three What wise. So that certainly proves that 7 combinations as told are passible The question is, how can the or any other spinites requirements to the contract of t

CHARGE ATIONS OF A METEOR IN FLIGHT
To the Middle of the Schemitto American
I have eign no mention in the newspaper of the
meteor that fell west of Corrington, North Dakota, on January 18th. It was seen for seventy miles south of Streeter, North Dakota and passed over us with great speed. It buried itself six feet in the ground about seventy miles north of Streeter The heat pro-duced was so great that for forty-eight hours no one quesa was so great that for forty-right numb no one could approach it closely notwithstanding the fact that the ground was covered with snow and was fromen to a depth of four feet. When the meteor passed over our heads from a southwesterly direction to northeast, it shone most brilliantly The no very large cannon ball in flight. The diameter of the or is 56 inches. It has been taken out and sent to Blumarck Streeter, N D

## SOME STRANGE ANIMAL INSTINCTS.

#### To the Editor of the Scientific AMERICAN

Two items in your science column of January 8th, 1910, interest me That about the return home of the kitten and cat because there are scientists in your own city and elsewhere who have held doggedly that own city and essewance was nave need suggestly that the special sense of this conderful ability to go back home is not a special sense but the result of some sort of observation, although the set may be blind folded. They even claim that homing pigeons find folded. They even thim that homing pigeons and their way back by observing the lie of the country. While this instinct is by no means uncrring, and is developed to a much greater extent in some individuals than in others, there seems no justification of the denial to these lower creatures of a faculty of orien tation or traversing which man possesses in only a small degree. There are many instances where the return has been made over a route very different from that of the outgoing journey and could not have been infinenced by the topography, even if it could have been observed

The other instance is that of the magpie which was fond of rubbing tobacco and its ashes into its plu as mentioned by the writer in Kosmos. This is of special interest to me because I had made a similar observation on a blue my—a relative of the magpio-and had never so far been able to confirm it from any other source Fortunstely as long ago as 1895 I recorded it in my little book "The Story of the Birds" (Appleton) from which I venture to quote

"I saw him (the jay) engaged in the walnut tree one day in late summer in a manner that made me fear that his bath had not been sufficiently effectual He would pluck off a leaf, lift his wing and rub it into 

strikingly odorous, for the sake of the portune only in which they seem to delight, but these two are the only instances that I know of where birds are re-corded as doing the same. It would be interesting to bear from any other instances—if there are any, as JAMES NEWTON BASKETT is likely

#### RE-ARMING OUR WARRING To the Editor of the SCIENTIFIC AMERICAN

In a letter to the SCIENTIFIC AMERICAN of Septem 5th, 1908, a correspondent, Mr A. B Wingfield, suggested the rearming of our "Connecticut" class of battieships with four 12-inch guns in place of the eight 8-inch that are now carried in the main battery of this Finch that are now carries in the main natury or that type. The Editor's comment at the time was that the greater weight of 12-inch gun emplacements on the beam would necessitate too costly structural strongth enings to justify the change, that the 4-inch armor protection would be too light for these emplas ments,

and that the increase in dead weight would sink the already low armor belt even lower in the water. A previous letter appeared in your issue of August 18th, 1908, and since then changes of this character have been under consideration

I know that if the SCIENTIFIC AMERICAN takes up this matter, its influence will be brought to bear on naval men, the object in view, of course, being to navai men, the object in view, of course, being to make dreadnoughts of the "Conorcitent' type and semi-dreadnoughts of the 'Georgia' class. The younger officers in the navy whom I have questioned in regard to this matter are unanimously in favor of these in

As armed at pres ent, the "Connecticut' and "Geor ia' classes are not as efficient as a comparatively nail additional expense could make them, and in small additional expense count make tneur, and in view of the conneeded superiority of the all big gun type of ablp, if seems worth while to consider how it would be possible to so reconstruct the above types as to make them more formidable against dreadmoughts.

The pre-eminent function of a battleship is to concentrate the greatest efficiency and power possible in a single vessel The armament of the "Connecticut" class consists of four 12-inch eight 8 inch, 12 7-inch, and twenty 3 inch, of which four 12's, four 8's, six 7's and eight 3 s can fire on broadside. The "Georg type mounts four 12 inch, eight 8-inch, twelve 6-in The "Georgia" and twelve 3 inch, of which four 12's six 8's, six 6 s, and six 3's fire on broadside Now to convert these ships to dreadnoughts it would be necessary to mount one 12 inch gun in place of the two 8 s in each of the beam turruts keening the employements as they are

As the 7 inch guns are too small for battle ranges and too slow for torpido defense they could be suband too slow for torpido derense they considered by the 5-inch rapid fires which are now being stituted by the 5-inch rapid fires which are now being treadnoughts. With say eighteen of these and a few more 3 pounders in place of the present twenty 3 inch gans, the change is complete and you have a vesse! the equal of the "Michi-gan' type which are really powerful dreadnoughts on

"Connecticut' displacement
In the "Georgia' class the same renovatio in the "Georgia class in same reconstitute would be made, extrept that the four superposed %s would have to be retained and the six additional fee omitted The 'Idaho' and 'Mississippi' could be similarly treated Under this arrangement the armanent of the two classes would now be "Connecticut" eight 12 link and eighteen 5-juch with a broadside fire of six 12 s and nine 5's "Georgia" six 12 inch, four 8 inch, and twelve 5-inch with a broadside fire of five 12 s, four 8's, and six 5's. Then our two 'Idahos, four 'Georgias," six "Connecticuts" two 'Michigans" and two "Delawares' would mount 124 12 inch guns in stead of 84 as at present, and would practically be a The benefits from these changes dreadnought floot are as follows

- A homogeneous broadside giving greater con centration of fire at battle ranges
- 2 A simpler system of spotting and fire control, with only one range to get and only one caliber of gun (excepting the four 'Georgias') in the main bat
- A greater efficiency of ordnance resulting from ore uniformity in ammunition and con-
- in handling A better organization for and the quicker deliv ery of shell
- An opportunity offered to hold former 7 inch gun crews in r serve for turret crews The c immation of unwieldy and inaccurate mid dle batteries with largo crews necessary to their serv
- ire in exposed positions
  7 A smaller number of mon in action at the time and behind heavier armor (Le, turrets only) at
- battle ranges
  8 An increase in the efficiency of torpedo defense by a gun more practicable in every way than the old caliber, which was ineffective at 3 500 yards and re-
- or, which was memorative at 3 hou yards and red d the same number of men to handle it. The lightening of the armor belt and bringing gher out of the water, where it belongs. The placing of the entire main battery behind

Now as to the cost For one battleship of the "Con necticut" class to be improved as shown above, the ex pense would consist chiefly of the price of four 12 inch and eighteen 5-inch rifles, and the remodeling of the and eighteen 8-inch rines, and the remodeling of the Sinch turrets and handling rooms The 5-inch guns could occupy positions behind the old 7 inch barbettes, on the gun deck the 3 inch casements (slightly on larmed) on the main deck and new mounts for the I do not believe that the structural part of the ship would need strengthening in any way Moreover, all these discarded sights, sevens, sixes, and threes could be mounted on smaller cruisers, where they could do the work required of them, and thus

noney on new construction could be saved

I think that you will agree with me in saying that
fifth these improvements made our pre-dreadnesight type will not only possess far greater efficiency than

in the first line of battle with future dreadnoughts The real question is this is this greater efficiency worth its cost? In view of the slight difference in worth its court in view of the siight emercuser in the cost of maintaining in commission a "Connecti-cut" and a "Delaware," I think it is and the Sciv-Tific American can do a lot toward making these paper changes realities. Brooklyn, N Y HAROLD M. KENNARD

|In publishing this interesting study of mosted question, we would point out that it seems to be the unanimous opinion of naval men in all navies that the rearming of the older ships does not pay, that in rearming of in our sups over not use, that all appropriations for construction should be put into new ships. Such changes as are suggested above would involve enormously costly structural work on the hulls. There is no room for 12 inch guns in the 8 Inch turrets -En ]

#### The New Supplement Cutalog

The publishers of the Scientific American have issued a new catalogue of the Scientific American Supplement in which 20,000 articles are listed Many of these articles have been translated from foreign or mess arricles have been translated from foreign publications which are ordinarily inaccessible to Eng-lish-speaking readers. Many of them also are papers read before the learned scientific societies of the world and accessible only in a few large public libraries. The articles are all carofully indexed so that the best information on any particular scientific subject may be found in a few minutes. The catalogue will be sent gratuitously to all who apply for it

#### The ( present finance

The current Rulliamyr, No 17st contains some remarkable pictures of the Seven Wonders of the World, together with a good article on them "The Practical Utilization of Insect Parasites" is the title of an article which will interest the farmer. Another installment of the Murros and Hall paper on "Occabustion and Explosion, a Primer on Explosives for Coal Miners' is published Some how uses of paper are described for D. A. Arthur contributes an article Color of the Coal Miners' and the Coal Miners' are supported to the Coal Miners' and the Coal Miners' are supported to the coal many that the common cut what colorised their new year, this strike comes cut what internal-coulosides pump is concluded. Leoured da Vinci, perhaps the only truly all-around genius of the world, is the supple of an excellent article by Ether of an article which will interest the farmer world, is the subject of an excellent article by Edward P Buffet The Wright injunction is summarised and llingirated

#### Comete Due to Beturn This Year.

in addition to Halleys, two other comets are due to pass through perihelion this year. The first is known as Tempel's second periodical comet, discovered in 1873 July 3rd at Milan Its period is about 51/4 years, and it was re-observed in 1878, 1894, 1899, and 1904, making its perihelion passage, on the last occa-sion, in November, it should therefore return this coming spring D'Arrest's comet, discovered in 1851, is the second object, and is due to return during the summer of this year Its period is about 6% years and it was re-observed at its return in 1857, 1870, 1877, 1890 and 1897 but it escaped observation, being un favorably placed, in 1903

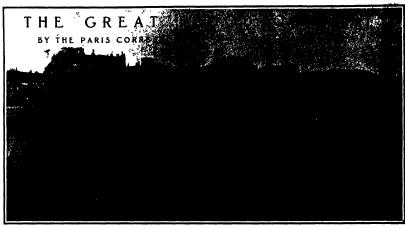

Mr Lynn, who gives those particulars in No 418 of the Observatory also recalls some of the historic oc-currences which have coincided with the returns of Halley s comet.

## The seientific American Fourth Dimension Book

The renders of the Scientific American have hardly forgotten the SCHNTIFK AMERICAN'S Prize Competition for the best simple explanation of the Fourth Dimen sion The prize of \$500 was awarded to Licut Col Graham Denby Fitch, USA His cassy was published in the SCHATIFE AMERICAN for July 4th. 1909 and o others which were accorded honorable mention Ly the judges followed in successive issues

It seemed to the judges that of the 245 ossays sub mitted, a certain number showed more than passing nulted, a certain number showed more than bassing merit Inasmuch as the popular liberature on the sub-jot is by no means extensive, the publishers decided to intrust to Prof Henry P Manning of Brown University, one of the judges the took of a lexiting some of the best contributions. This Prof Manning has done. These seasys ingesther with the cassays which were awarded the prize and homorable mention, are now published in a book which has just been insued by Muna & O. publishers of the Kerverira Aussicas. An elaborate introduction is provided by Prof ning in which he critically and yet simply discuss fourth-dimensional geometry and gives an excellent hibliography on the subject The book sells for \$150 and can be ordered through any newsdealer or book seller

The deepest coal seams mined in America lie ab a depth of 2 200 feet some of the coal mines in Eng-land are developing seams at a depth of 3 600 feet while coal mining is carried on at a depth of about

The Seine near the mint.

The inundation of Paris made many of the streets of that metropolis as navigable as the canals of Venice that metropolis as navigable as the canals of Venice The highest point reached by the water was 31 feet 4 inches above the normal at the Pont Royal Not since the historic flood of 1615 has Paris been visited by such an inundation On January 29th the waters began to fall, and the city for the first time began to feel safe Even as it was, the Seine was swellen to to the sea twenty times faster than usual. The banks have been overflowed for from haif a mile to a mile on either side. That vast and wonderful sewer system which figures so dramatically in Victor Hugo's 'Les Miscrables and which has been dwelt upon time and time again in every guide book of Paris, and that intricate system of subways which handles the vast traffic of Paris, have both played their part in this catastrophe. They served as conduits for the flood liuge as they are, they were unable to cope with the turbulent waters. Pavements were pressed upward, and the water bubbled up into the streets. Apprehen and the water pushed up into the airwest. Apprehen-sion was foil for the safely of the monuments of the French capital, an apprehension which is not yet stilled it seemed almost certain that their founda-tions would be sapped. It speaks well for the work of French engineers that none of the twenty four bridges that span the Seine was carried away, and that it was found necessary to close but eight of them On the cther hand, these bridges undoubtedly helped to dam the waters and to aid in the citys inundation. It speaks well for the architects and masons of the middle ages that the famous Cathedral of Notre Dame

uld have stood in a lake for days and days without snoun have stood in a lake for days and days without suffering injury Many of the historic buildings of Paris were flooded, but fortunately the art freasures seem all to have been preserved with little or no figury When the saturated ground dries out and contracts, it may be that some of the buildings will settle and possibly collapse. The Louvre, although flooded, was still able to serve its function of housing its pricewas still able to serve its function of bousing its priva-less pinkings and its statuse. The great shops could not be opened on account of the water. The fances liberty Francis still gave its performances, but it used candles as it did back in the days of Mollare It was but satural that the Chamber of Deputies should have continued its seasons and exhibition of right on the part of the legislators would undoubtedly have heightened the public terror. As it was, the numbers were ferried arross the equars to the cham-

hemores were lettric across to a square to the trans-ber. The old Latin Querter and the Champ de Mars, the Rue Royale, the Houlevard Haussmann, the Place do la Concorde, the Champs Elyssés were swamped Naturally the authways suffered heavily. Only the Gare du Nord seems to have escaped. The station of

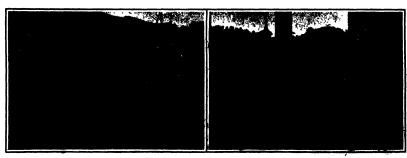

St. Lazaro seems to have suffered most severely As it was, the suburban traffic was entirely cut off, so that it was, the suburcan trame was entirely cut of, so that the sparing of the (eare du Nord served simply to give the frightened populare a place of questionable rofuge Fortunately the waters rose so gradually that the lulubitants of the sewers (the theme of many a the numbitants of the severs (the teems of many a thrilling French short story) and of the basements and sub-cellars of Paris were able to escape. Buburban towns lying somewhat lower than the city have suffered. The breaking of a dyke completely inundated Gennevilliers. Its community of 10,000 pers

demonstration. In community of 19,000 persons and driven out by ten feet of water. Paris may now be considered safe from water, but the danger from sickness still prevails. The stench of the stagnant water and of the drowned animals will undoubtedly continue for days. The Paris health orities will find difficulty in coping with that situation

The actual cause of the food has not been tally revealed Some explain It secondarily by arruing that the basin of the Science had become acturated during a mild winter, characterised by heavy rains and little caporation. It will be safer before accepting this theory to avait the investigation of the municipal engineers. Only when the floods have subsided and accredit examination can be made, will the full measure of the diseaser be assertained. The accounts of burst-ing severs and sulways and caving streets point me several and sulways and caving streets point in several contents of burst-ing several and sulways and caving streets point the famed Parisian sever and sulvay systems. It is probably be nomitae before Paris will conduct business as it did before the flood.

The antipering aspects of the flood have been self-

The engineering aspects of the flood have been suf-ficiently discussed in our editorial of February 5th. For that reason the results of this Parisian inundation acced not here be dwelt upon again It is clear that anot not here be dwelt upon again it is clear that either the channel of the Selien must be widened by dredging, by the removal of river plers, or by the inordinately expensive construction of an artificial waterway around the city, a waterway which will serve the purpose of diverting the surplus of the Selien in time of food and of discharging it below the city.

The goodeliers of Paris.

A cart-terry in one of the size

- Recisionation of the Principlus Page Stock.

This total area of the past loop and morrs of Germany is more than 3,000 square miles, of which about two-fittle are situated in Hanneyr and Schleswig-Holsidat. The Pression government possesse in East-Priesland marty 4,0000 acres of upland morrs, of which about 10,000 acres, known as the Agrick. Or "Pricebology loop, have for roller parts boat the boom of the page on with great skill and energy, though unfortunate tunately on wins great sain and onergy, though uncorumnately with a degree of secrecy which makes it difficult to assertable the exact facts, sithough the undertaking is of the greatest and most general importance. It is consistent and the control of the

Il supply electric cur-nt he light and power the matter of thirty let. Electric light, thus of, is already supnod several other es and towns, and large titles of ammonia, hygen sulphide, and other cour products are sold in various indusclaimed lies between the ns-Jahde canal on the north and the Nordgeorga-fehn cabal on the south, between which a connecting canal will be con structed. Short canals will connect the system with the canals of the older moor colonies to the westward. In all, 38 mile new canals will be re-quired Their construc-tion will necessitate the stripping of about 850 acres of moor, from which it is estimated that nearly 350 million cubic feet of peat will be obtained Tf this work were done by ds would not be fin-

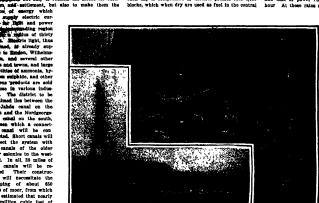

iabed in several decades, during which period the price assed in several occases, during which period the price of peat, already very low in this district, would con-tinus to ducline Both of these difficulties were avoided simultaneously by the adoption of electrical methods, by which the work of excavation is carried on very rapidly and supplies its own fuel In the center of the moor is a boiler plant, which consumes peak ter or in moor is a solier plant, which consumes peak acclusively. The problem of course, will be still more simplified when a method of producing electricity directly from heat is developed.

The first settlers established on the Friedoburg moor

The first setters established on the Friedoung moor will carry on what is known as surface cultivation, and will at the same time gather peat, which they will sell to the electrical company, the charter of which runs for seventy five years. As the high moor is thus the r ethod of cultivation will be gra changed to that which is employed in the low-lying of Holland

All of the energy is supplied from the central power station of the Siemens-Schuckert Company, situated

on an island in the bog at the intersection of two main roads. From this point wires, supported by poles, radiate in all directions, supplying light and wer to the whole country for many miles The main canal is bordered by several rows of po and wires, one for the telephone, another for the postdigging and agricultural machinery, a third for the high-tension alternating-current long-distance service supplied to the surrounding cities in November of this year. The station is equipped with two steam turbines of 1,800 horse power each. The great plows used for the excavation of the tanais have iong been driven by electricity. The peat dag each day is compressed by electric process into 4,000. blocks, which when dry are used as fuel in the central

Scenes from the great Paris flood.

station In the gas at perators 40,000 cubic feet of fuel gas and 30 pounds of ammonium sulphate are obtained from 100 pounds of peat. The combustion of this quantity of fuel gas gonerates 273 horse power hours of energy, while the sale of the ammonia compounds ood interest on the capital invested tracts for supplying light and power to most of the surrounding towns and cities have already been signed. The duration of the contract in most cases is forty years, while the charter of the Siemens Schuck ert Company will remain in force seventy five years
The area assigned for cultivation and mettlement com prises about 17 000 acres. The digring of the canal requires the peat to be removed from a strip about 150 feet wide, so that the construction of the 38 miles nal will involve the stripping of 650 acres average depth of the peat is 11½ feet. Deducting the superficial stratum of 30 inches, which is compara-tively worthless, the digging of all the canals will produce about 247 million cubic feet of peat, which

when dried will furnish 1 1/3 million tons of fuel peat. This amount of fuel alone would supply the central station, producing five million kilowait hours of en sixty-six years On each side of each car a strip 165 feet wide is to be cleared of peat for cultivation and settlement The peat thus obtained, added to that obtained from the canals, would enable the capacity of the station for the duration of its charter be tripled

An idea of the cost of the electric light and power thus furnished may be gained from the contract re-coulty concluded with the town of Baut, in which the price of lighting current is fixed at about 10 tents and that of power current at 5 cents, per kilowatt hour At these rates a 16-candle carbon incandescent

lamp or a 40-candle metal samp or a 40-candie metal Blament lamp would cost about 1, cent per hour and an arc lamp from 2 to 6½ cents per hour ac-cording to its candle power Thus the Friede burg bogs are to be util-ised as a field for colonisation, as a source of Hight for the surrounding coun try within a radius of 30 miles, and as a cheap and reliable source of power for all the cities and farms of Ea though all the hopes which have been built on the en terprise may not be ful filled, it is already certain that the reclamation and cultivation of bog land has entered upon a new and promising stage of de-velopment in consequence of this application of electricity It must be admit Friedeburg moor the con ditions for reclamation are especially favorable The land is in general level, and it has already superficially and smoothed by burning The roads through the moor are already bordered

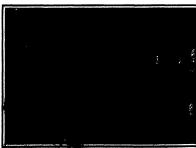

with rankly-growing grass

Peary a Bear Admiral.

Commander Robert E Peary has been made a roar admiral of the highest grade and with maximum pay. so far as the Senate can accomplish such recognition of his services The bill recently introduce ator Hale was favorably reported from the Committee on Naval Affairs and promptly passed without dis

The bill authorizes the President to appoint Comr Peary a rear admiral with an extra number and places him on the retired list. An amendment was adopted giving him the pay of a rear admiral of the first grade

The top notch pay of a rear admiral is \$8,000 a year and that of the same officer on the retired list three fourths of his active compensation. Thus Admiral Peary will receive \$6,000 a year for the remaindur of his life

The submerged Rue de Lyon.

# Industrial Chimneys and Water Towers of Concrete Blocks

BY H. PRIME KIEFFER

The employment of concrete blocks for the construc-tion of factory or industrial chimners and water tow ers is one of the most mainril use of that new form of building manufal. It is very surprising that the iden of willists, separately molded blocks for this per pose should have come from Europe instead of Amer ica where blocks have found a wider range of use than in an country in the world. The system is the ideal one for the rapid exection of factory chimneys. In the United States there have been in use some twenty different systems in which armored concrete is employed but they all have some primary form of is implicit that they all have some primary form a saffolding in their designs. This is the underlying reason sky those thinneys cannot be constructed more commissing and rapidly. The method of constructing thinness of separate is mobiled constructing thinness of separate is mobiled constrainting the invention of M. Duman, an engineer and architect of I mass is Biglium. It has controlled by Lon Monneyer of Pils also of truescle who furnished the data and photographs for the present article. The system is notable for its simplicity its beauty of form its econ omy in cost, and its adaptability to rapid constru

The chimness are like all others in that they are ed of three pasts the foundation the base and the shaft

of a special design. The in the accompanying dia gram. The number of blocks in each course at ways remains the same, yet there is a taper to the chimney They are placed in regular horizontal courses to the required height and upon the top is placed a special capping block of either concrets cast from or cut stone The builders work on

a rough platform and from the interior of the stru ture and each block is re coived by them ready for its particular position Two men are usually em ployed above in laying the blocks, and two below to blocks, and two below to hoist them to the platform. The blocks in each suc-ceeding course are placed in the opposite direction, that is to say, all the even courses will have the same direction and all the odd courses will take the rener, the joining of the blocks of one course where they do not meet perfectly will be covered by the blocks in the course by the blocks in the course showe As shown in the diagram each block has at one of its extremi ites, a 'hook' similar to the shape of the letter 'U'' This "hook" forms a hollow space which ex-tends the full length of the chimney and of course there will be just as many then are sides to the chimner Through these vertical hollow spaces are placed vertical from rods B, varying in diameter as cording to the height of the structure At each

course these rods are fied or bound to the courses by U-shaped flat from yokes These in turn, are wired to a small iron ros D which is placed between the courses horizontally and in a groov made for it in the top of the blocks

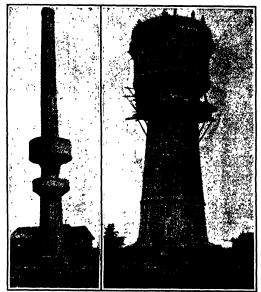

The placing of the vertical rods in the openings and not in the substance of the shaft proper forms an important advantage of this system. The rein forcement is thus kept at a low temperature, and is not subject to the injurious effects which would arise nor an open to in injurious errors which would arise from unequal expansion if the steel was in the center of the mass. Ferror operate is indestructible by fire as long as the temperature of decomposition of courete is not reached but it must be remembered. that although the co-flict of expansion of cement are the same, the co-efficients of conductibility are very different, and fracture is likely to arise if, from this cause, the temperature of the iron exceeds that of the concrete Consideration of this condition is espe-cially important in the case of a structure which is heated on one side only, such as a chimney

A clever idea in connection with the design of the blocks is that there is need for only three, or at the most, four sizes of blocks for the average chimney

- The vertical steel orderioring rod The concrete of the ideal.

#### INDUSTRIAL CHIMNEYS AND WATER TOWERS OF CONCRETE BLOCKS

150 feet high and with a taper of one to three percent. This is made possible by the following arrangement. The mode by which the blocks are made one sist of but three cast-iron places, hold together by wooden stop blocks, and three ordinary iron clamps of the control of the 150 feet high and with a taper of one to three per

each succeeding course has a diameter smaller than the one below it, and in this manner, the taper of the chimney is obtained. As the longest bleds are some three feet in length and the distance across the seral circular opening about six to eight inches, it is possicircular opening about act to sight inches, it is possible to make a condérable taper in this manner. For a taper of 1½ to 2 per cent, the sin-wife the blocks in changed every forty or fifty feet. This blocks may, of course, be laid with absolutely no isper, and then one size, only, of thebeas is also some size, only, of thebeas is used Some shitmaps have been constructed on this plan, but their appearance in not so generate as these having a slight super. The concrete blocks are usually making at the about the concrete block factory, and this may be ignomested in case there are several chimneys under construction in the same direct. The proportions for the concrete

case there are several climners under construction in the same district. The proportions for the conserved mixture vary somewhat, but the usual saixture consists of about five parts gravel, three of sand, and two of cament Dust of stone is used sometimes, and has given very good results. From an archimetural point the chimneys constr seent a pleasing appearance Being thinner than ck chimneys, they rise more gracefully from their ses, and yet the strength and stability which they irick chim

attually possess is at once suggested to the eye by the appearance of strength which is presented by the protruding rounded angles. A number of chimneys

A number of chimneys and water towers have been built in Europe after this system, and the two photographs presented in connection with this arti connection with this arti-cle show a water tower, and a combined water tower and chimney. The water tower which is lo-cuted in Uccle, a suburb of Brussels Helgtum, will be used in connection with the 1910 exposition to be held in that city tower and tank have a height of 145 feet and th height of 145 feet and the latter has a capacity of 280,000 gallons The struc-ture is circular and is built entirely of concrete blocks and without mold ing of any kind excepting that used in the building of the concrete reinforcing struts surrounding the base of the tank proper The inside of the tank is built up in practically six stories connected by a winding stairway These different floors are divided into rooms which will all be occupied by anginoers. foremen and other work men during the exposition The stateways are placed long the outer walls an the water remains in the center inclosed by a con crete covering of square

# Oil That Cold Will Not Affect.

It is often difficult to keep machinery properly oiled in cold weather, as the oil freezes in the oil holes and the cups, and the oil upon the ways, of the

lathe and planer becomes stiff, causing the machines to work hard. A good oil for winter use is made by to work hard. A good oil for wither tise is made by mixing graphito with cylinder oil until in a thick or jesty consistency, and then adding kerosene until it flows freely. This oil will not become stiff at 14 degrees below sero, and it valuable to those operating machinery outside or in cold shops.—Power

In his presidential address to the American Street and Intervitum Railway Association, Mr. Shaw, at Donver, said that in round numbers there are 1,350 street and intervibus railway companies in America, with a total of 3500 millies of single-track and finite with a total of 3500 millies of single-track and finite present the property curried annually in 1,000,000, and the gross income \$44,000,000. ----

#### THE CONSTRUCTION OF AN IMPROVED SILICON DETROTOR BY OR

The detector described here is one that can easily The detector described new is one that can easily take the hame 'improved,' being a radical departure from the coarsely-adjusted detectors generally used if properly constructed and connected, it will easily pick up wireless messages sunt from very distant points. The component parts are shown in Fig. 1

The base of the instrument is fashioned from hard The base of the instrument is rasmoned from hard rubber, 3 x 2 x ½ inches, ½ inch holes are bored in it one inch from either end A support for the crystal cup is made from annealed brass, 4 inches in length %, inch in width, and 3/16 inch in thicke bent to an L shape, as can be seen in Fig 2

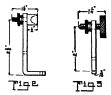

The crystal cup is turned from brass rod 1/2 inch in diameter It is threaded, as soon in Figs 1 and 2, to fit a thumb nut. The crystal is fastened in the cup by means of lead. This insures a good contact. The ad-

Tiq. 1

#### SECTIONAL VIEW OF THE ASSESSMENT DETECTOR

mechanism can be made to move a steel half spiral, the point of which makes contact on the silicon to the thousandth part of an inch. The phospho-bronze strip upon which the spiral contact is fastened is 3 inches in length, 1/2 inch in width, of No 28 B & S gage sheet It is boiled to a cube of brass which in gage sheet it is boiled to a cube of brank which in turn is fastened by means of a machine screw to the base. This wrew serves also as a binding post. The brass post supporting the adjusting screw is of 3/16 inch brass of the same stock as the L-shaped post. It is 214 inches in length, % inch in width, and 3/16 inch in thickness. A 1/4-inch hole is bored 1/4 inch from

SUPPORTS FOR THE CRYSTAL AND THE ADJUSTING

one end to admit the machine screw that binds it to the brass cube Another hole is bored 1/2 inch from the other end and tapped to fit the adjusting acrew. The adjusting acrew has a large knurfed rubber handle for adjusting purposes, also a lock nut to be tightened when the detector is at its most sensitive point

This detector is comparatively easy to construct and is lnexpensive. The one undesirable quality in silicon detectors—their ability to get out of adjustment—is almost entirely eliminated in this detector, due to the use of the spiral instead of the solid contac

#### INCREASING THE EPPICIENCY OF WIMESURED REBOTRIO MACHINES. BT GRONGS / BURDOUR

The Wimshurst static electric machine, as is well known, consists of two glass: (recles revolving on a com-pound axis in opopsite directions. As nauslly made, this machine is inferior to the Tospler-Holtz type, al though somewhat cheaper to make, and superior in simplicity The latter quality has been without doubt ever the small electric discharge this machine will

give as commonly made, will answer the purpose.

In building both kinds of these interesting chines it is the practice to varnish the revolving g circles with white shellac dissolved in alcohol higher grade machines the best quality of shellar and grain sleehol are used for this varnish buffer the toy arlety wood alcohol and the cheapest grades of shells d Some years ago the writer was building both Wimshurst and Toepler Holtz statics, but was un able to obtain a discharge from the Wimshurst type that could compare with the other kind, even wh

that could compare with the other kind, even when the glass tricks were of the same diameter. The development of the machines in both tases had extended over a series of years, and it was supposed the limit was reached. At this time the Toepler Holtz were giving with 26 inch circle (using the Leyden jars) equal to the radius of the circles or 13 inches long thick as the thumb and when discharging detonating like the sound of a rife

The Wimshurst machines with an equally large (in uld not give sparks over 4 inch long, and as thick as a knitting needle. Finally, in building a lot of six machines it was found some were much bet ter than others. Hirenuous efforts were made to asserat caused the increase in officiency but v discovering anything different in the construction of those that showed the improvement from the others in the next lot after this, however, all of the machines aere capable of giving sparks 6 inches long, although the diameter of the glass circles was but 14 inches The thickness of the spark had also increased to the size of a pipe stem and this wonderful increase of efficiency was attributed to some quality inherent in s of which the circles were made made of the manufacturers of the glass fatled to disany different methods of making the glass than

had been followed for many years

About this time the writer in varnishing some circles held one of them up to the light and was struck by its light green appearance and although giving it little attention at the time gained the impression that this change in color might have something to do with the increased efficiency still unaccounted for after this a new lot of machines were built and every one of them had reverted to first principles so far as the spark was concurred it being short weak, and spindling. In the effort to find out what had caused the reversion the writer called to mind that just be varnishing the last lot a new brush had b in a new batch of varnish

is customary in making the varnish to dissolve the shellac gum in a glass jar with a mouth just large mough to get the brush in conveniently and the brush is left in the jar between the construction of the differ ent lots of muchines. It was found that the old brush had been shedding its bris ties, and to prevent this had been bound around with some fine copper wire The action of the varnish had been to corrode the cop per and the sait had given the varnish the faint green color noticed some time before on the gimes cir cles, although there had been nothing different in the

color of the body of varnish in the jar apparent The suspicion dawned on the mind of the writer that this had been the cause of the increase of efficiency and the lack of it in the last lot of machines batch of varnish was accordingly made, and in it was put about a quarter of a pound of fine bare copper wire. A new brush was procured and placed in the jar and the varnish allowed to stand in a warm dark room about a week, when it had assumed a light green sed to coat the circles of a new ma

This machine was found on trial to be even more efficient than the best of the others

In experimenting with the newly discovered varnish it was found that if it was allowed to become a dark green the voltage of the machine was interfered with and while the spark would be thicker it would not jump as far. The best results were obtained when the rolor was a very light green. The reason for the in creased efficiency was thought to be due to a decrease of the relistance of the shellar between the sectors on which the equalizing brushes bear

This varnish was tried on Toepler-Holtz machines without their showing any marked in rease perhaps due to their being air ady capable of delivering sparks equal to the radius of the glass circles

The use of varnish made in this way will be found

by amateurs and others to add greatly to the capabili-ties of the Wimshurst ma hine, and besides the light green color on the glass adds to the beauty of the in-

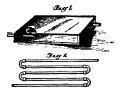

Many builders of Wimshurst machines as well as those experimentally inclined have trouble in making the brass sectors stick to the shellar. As tinfoil soon wears through from contact with the equaliser brush wears through river counter with the better grades of machines to secure durability. Brass sectors can be made to sirck permanently in the following manner in varnishing the divide about three conts is governally applied with a large flat camel's hair brush

Each coat is allowed to become moderately hard be-fore applying the next. After the last coat is ap-plied, and has stood about fifteen minutes mark the ons where the sectors are to go (they sho evenly spaced), and after applying some varnish to the evenly spaced), and after applying some various to the under side of the sector, press it down into the soft variable until a slight ring swells up around the margin of the sector. After the varieth is hard an examination will show the sector devetaled him the variable from the sector devetaled him the variable. from which it will never separate as it will if comented in any other way on account of the expansion and con ns of the brass being so much greater than the glass, and causing the sector to become le

## SILVERING GLASS AT HOME.

#### ---

A good glass inferor mids with on a own hands is a filting to be proud of Wirrors are now selfoun made by the Hinfoll and meturn process because of the drag-ross sharater of the work but pure silver be drag-ross to the sole and bread The silver provess in soil in the least dangeross to the workman. The formula her given to one that has been in use in several booking gians. and art mirror factories in the city of London

APPARATUS REQUIRED FOR SILVERING GLASS.

themicals used must be of absolute purity (chemically pure) and all operations in preparing the glass must be carried out with care and scrupulous cleanliness The surface to be silvered must not be pressed une by the fingers or thumbs they would leave an indelible impression

The first thing to be done to to make a -The first thing to be done by to make a small table out of a piece of slatt about %, or 12, link thick 10 or 12 linches wide and 18 linches long. These measure-ments are not bluding, any piece of slate about the above size will do. A wooden trough must be madegrooves at the top edges for the slate slab to re There must be a some of 2 inches between the In There must be a space of 2 Inches between the shats sids to the woods bottom as indicated in Fig 1. In this space is a cell of pipe arranged as shown in Fig 2. The pipe to of short N, inch bore and through it steam is passed to raise the temperature of the side sids to should 1.0 deg F. In fact just hot enough for the hand to bear. The steam can be supplied from an ordinary ten kettle place down earth depositing table with a rubber tube connecting the cell to the specul of the kettle. Herbers, banderich the date the should the kettle. Uniform heating of the slate slab is eason tial. The coll can be easily made of ¼ inch iron gas piping screwed into Ushaped cast iron connectors, as shown in Fig. 2. The slate slab can be covered with black oile loth and made perfectly level. The following stock solutions must be made up and carefully filtered through absorbent cotton ready for use

Stock Bolution A - Nitrate of silver 3 ounc tilled water 10 ounces strong water ammonia 12% ounces. This solution must be stirred well and allowed to stand five or six hours, then add 10 ounces. more of distilled water and filter

Stock Solution B -- Rochelle salts 4 ounces, distilled water 20 curren

Stock Solution C Distilled water 40 ounces, protochloride of tin 5 grains

Clean the glass plate or plates with very line rouge and water taking our that no trace of grease whatso tver comes into contact with the glass or the cloths or chamois leather used for polishing. When cleaned the plate must be flooded all over with the tin solution Pour this solution of and wash the plate well with distilled water. Las the plate wet side up upon the table with four clean wood wedges at each corner Let the glass test on the wedges so as to allow a slight adjustment if regulard for leveling. The mix ture for allvering is made up as follows

Distilled where 20 ounces stock solution B I drackin by measure stock solution A tounce by measure The glass plate being quite level and still set pour this mixture carefully and slowly upon the con ter II will flow events all over until it stends shout one-lighth of an inch deep all over the plate. Any tendence to run to one end must be rectified by the The plate now being completely covered with the silvering mixture must be left to itself for about two hours the heat being kept up during this thouse and when it is found that the whole of the silver has deposited the liquid must be poured off by tilting and allowed to run into a stoneware crock and saved Scientific American

for the waste silver it contains. If it is desired to increase the thickness of the deposit of silver, the op-eration must be repeated as soon as the silvering in complete, wash the plate well in a soft stream of run-ning water, stand it cornerwise to drain and dry When dry the following protective varnish must be as a coating to protect the deposited silver Shel isc, 1/2 pound, wood sicohol, 6 pints As soon as this use, ½ pound, wood aiceond, 5 jirite. As soon as troching has dried it must be painted over again with the following paint. Red lead ½ pound, white lead, ½ pound, mixed with enough boiled oil and a small quantity of jurys after to make a good covering with a single conting. A small quantity of gold size must also be dided to insure quick drying and a tough adhermance. ing quality. The mirror is now ready for framing if much work has to be done, it will be advisable to cover the slate all over with a place of felt, and keep the felt wet during the operation for two reasons.
First no pieces of woollen fiber can settle upon the plate, and secondly, the heat from the slate slab is communicated to the glass better than from a dry sur-

regular workshop a very go feet with a guiter cut around the siab, so that the spent silvering liquid can run from the tilted plate, around the table and be collected by running through a hole at one corner in this case the liquid will be sure to come in contact with the felt. This will prove of no consequence because in time it will become sat-urated with silver, which will realize twenty times its first cost when sent to the silver refiner, and not only pay for a new felt covering, but increase the siz the pocket book at the same time. The quantity of nitrate of silver required to coat a square foot of glass with a moderate coating of silver is 18 grains estimate as to cost can be made from this amount An

# SELENITY CELL WITH CONTACT BY PRESSURE

The usual method of making a scienium cell con wists in prewsing the electrodes against a piece of crystallized scienium, which decreases its resistance to electric current, when submitted to the action of the The quality of selenium can be perfectly con tiolled, as it needs not come in contact with motal when fluid in which state it dissolves nearly all metals (1 c, the electrodes) This is of importance, because small quantities of other elements sometimes have considerable influence on its sensitiveness. More over a piece of selenium, that for some reason has los over a piece of seconium, that for some reason has lost the efficiency, can be easily replaced by another plece, at low rost. The most important point, however, is that the contraction or decrease in volume (5 to 8 per cent), which is inseparable from the process of crystallization, has no influence whatever upon the tact with the electrodes, as the ploce of sel-

SELECTUR CELL WITH CONTACT BY PRESSURE.

given its definite form after the contraction has take Strong currents of short duration do not lead to the destruction of the cell, as there is full scope for expansion

Despite these important facts, this method has not been hitherto used because very thin plates of selen inm are necessary as the action of light is limited to an extremely ithin layer of the exposed surface (cal-culated by Marc to be about 1/500,000 inch thick) Moreover, selentum is rather fragile and being of high resistance heavy pressure must be used in order to realize good contac

The author discovered that selenium, when molten between a cold and a very hot glass plate, strongly ad heres to the latter, after the crystallisation. It is thus possible to cover a thin (1/250 ipch) flexible glass plate with an exceedingly thin coating of selen ium (1/1 000 to 1/30 000 inch) which has a highly polished surface that gives very good contact with the electrodes. These consist of gilt stripes on a glass plate (Fig. 1). There are from 250 to 2,500 electrodes on every inch

on every inco.

Cells constructed after this method are very reliable
and show remarkable constancy. They are of small
specific working surface. The following is a descripition of a cell actually made.

Working surface = 14 by 14 inch Resistance in the dark = 20,000 ohms.

Rosistance in ordinary daylight == 10,000 chms. Resistance in strong light=3,000 chms. Maximum intensity of current=0 0018 ampere

Fig 2 gives a diagram of the call.

Fig. 3 is an end view of same Glass plates with a thin coating of metal (silver) have before now been used as electrodes for substances sensitive to light This combination or at least the ults attained are nev

### SOME SCIENTIFIC AMBRESETS.

The Candle and the Funnel—Ask a person to ex-tinguish a lighted candle, two feet distant from his outh, by blowing through a common tin funnel with his lips applied to the stem Almost invariably, he will fail to accomplish the feat, although he could easily have blown out the candle without using the funnel Now put your own mouth to the stem of the funn now put your own mouth to the stem of the runnel and blow out the candle If you have any skill in per forming tricks you can repeat this one many times without betraying its secret to the average speciator. The secret is this When you blow into the small end of a funnel, your breath follows the inner surface ond or a runner, your reast notions and not not the cone, and not only shous the axis, but produces cddles of such a character that there is actually a slight back draft or inward current at the center of the wide mouth of the funnel You, therefore, hold the

RIGHT AND WRONG WAY OF BLOWING OUT A CAMBLE

nel so that some part of its conical surface would, if extended, strike the candle flame An inexperienced person naturally directs the axis of the funnel toward the candle and consequently fails to extinguish the flame if he stands quite near the candle and blows gently the flame will even be drawn toward the funnel by the inward current. The whirling motion of the air may be made visible by using a glass funnel and filling it with tobacco smoke

adoxes of Ebullition.—Everybody knows that Pa water boils at the temperature of 213 deg Fahr if an uncorked bottle partly filled with water is set in a saucepan containing water in which a good deal of salt has been dissolved, and the pan is heated over a spirit lamp or otherwise, the water in the bottle will begin to boll while the water outside still remains perfectly quiet Yet the water outside must be at least as hot as the water inside (212 deg Fahr), for the latter is heated by the former Hence we see that water which contains salt in solution does not boil at 212 deg. Fahr The same effect is produced by dissolving any other solidesubstance in the water

Now, if the bottle is taken from the hot brine and corked, the water in the bottle stops boiling, but it will corsec, the water in the notice acops conting, but it will bell again, were after it has cooled many degrees, if cold water is poured on the upper part of the bottle. The explanation is that the boiling point of water is affected by pressure. It is about 212 day. Fahr under the ordinary pressure of the atmosphere (exactly 212 the ordinary pressure of the atmosphere (exactly 213) and dog when the harmonier stands at 20 Inches) but if the pressure is reduced, water boils at a lower temperature. When the water boils are a lower temperature when the water boils was cortool and taken from the fire, its upper part was filled with steem at atmospheric pressure, which had arguited the air originally present. As the bottle cooled, this seems partly condensed and tip pressure was diminished, but not sufficiently to permit the water to boil, because the water cooled also and its gradually diminishing temperature was always a little below the boiling point corresponding to the actual pressure. But the application of the cold water caused a rapid condensation of steam and a sudden lowering of the pressure without having much cooling effect on the water, which

without has ing much cooling effect on the water, which consequently began to boil.
Distribution—The same apparatus may be employed in the process of distribution. The same apparatus may be employed in the pass is replaced by fresh water, a hole to broad in the eops and a glass tube is fitted to the hole. To the water in the bottle is added one-tent its volume of alcohol, or less. The bottle and pan are placed over the lamp, as before, and beated gently. Before the water in the pan has reached the boiling points with a lib-range of the more roistlie sloohol (mixed with a lib-

tle water vaper) issues from the end of the giass tube, where its presence can be detected by its odor or by the application of a lighted match, which will result in the production of a tall blue flame. The jet should not be lighted until the mixture has been h nor we rigated until the mixture has seen heated long enough to expel the air from the bottle, as the ignition of a mixture of air and slochol would produce a vio-lent explosion. For this reason the cork, though it should be air-tight, should not be inserted too tightly snould be air-tight, should not be inserted too tightly With this precaution an explosion will drive out the cork, instead of shattering the bottle. This experi-ment, and the others performed with this apparatus, should not be attempted by children or careless per-

Hero's Founiain.—If the jet of films issuing from the tube is extinguished and the tube pushed down until it dips into the water, a fine liquid stream will

be thrown high in the air by the pressure of the mixed vapors of alcohol and water in the upper part of the bottle --- Kosmos

#### A SIMPLE EFFECTIVE FILTER.

The filter here described was first made by the writer in 1878, and used originally for filtering gelatine emulsions. As a water filter it is both simple and effe Procure an ordinary kerosene lamp chimney Fit over the end of it two or three thicknesses of washed chesse cloth Press a tuff of absorbent cotton into the small part of the neck for about three inches in depth, ins

HOME-MADE PILTER.

the chimney, and place it in a hole cut in a weeden shelf as a support. Pour the water in until the fitter is filled, when it will be observed that any organic and tor, chips of fron rust, etc., will be rotained by the cotton The fine organic matter may penetrate the cotton for about one inch, but no farther The result-ant filtered water will be bright, clean, and pure

A paper dealing with "Research on Metallic Filament Lamps," by Mr F H Reakes Lavender, was recently presented at a meeting of the Birmingham Institution of Electrical Engineers. The research was undertaken in order to investigate the conditions of working as regards voltage, and afficiency and poreentage drop in candie-power, giving the most economical life in the in candie-power, giving the most economical life in the case of metallic filament give large, and to determine as far as possible the cent of limination with this source of light. The author stated that the useful life of a lamp, and the drop in candie-power which it was advisable to allow for a given voltage, depended on the cost of current and the price of the lamp. The chasper the current and the price of the lamp. The chasper the current and the price of the lamp. The chasper the defined by the control of the current at 64, per nutt a stated when the control of the current at 64, per nut as na average price, and the lamps are the voltage, then it paid in the case of the tantalum class of lamp throw throw it aways as one as the confidencement at father than its paid in the case of the tantalum class of lamp. then it paid in the case of the tantalum class of lamp to throw it away as soon as the candle-power had fallen is 3 per cent below its original value. This result ap-pared starting at first, considering the large initial cost of the lamp However, by the time that point was reached the lamp had been berning for 1,500 hours at the best possible effection, so that the cost of the lamp per decoming middle of the cost of the lamp had become small.

## OTHER WORLDS IN SPACE

(Continued from page 180) graph is being taken. A careful of with such an accurate instrumen with such an accurate instrument will obtain the spectrum of the star in the middle of the photograph fanked on either side by the spectrum of the metal iron or titanium or the gas hydrogen, placed there by the use of the electric current and induction coil Astronomers use different metals for the purpose of comparison, the Yerkes Observatory, for instance, employs both iron and titanium on the same plate
A good photographic spectrum will the

consist of that of the star to be investi

gated, supplemented by the lines of gates, supplementally the lines of the comparison spectrum How are these spectrograms to be interpreted? And how can they tell us anything about stat-lar motions? Remombering that light is a wave motion, we have a simple analogy in the case of sound, and one with which everyone is familiar In traveling in an express train which passes another soing in the opposite direction, we have us noticed that the pitch or tone of the whistle or bell of the other engine sud-denly drops as it passes by us. The res-son is that sound is also a wave motion (though the waves are much different from those which cause light) and the quickly approaching engine causes more waves to crowd into our ears each second of time than it does when the engines are not moving. As the tone is determined by the number of waves which fall on the ear drum every second, the consequence is that the pitch of the whistle or bell is raised while the two trains are approach ing, and for the same reason it is lowered when the two after passing are going away from each other. The change in the of canage and the control of the con come into the eye Evidently the shift from the normal is excessively small, but even so, it is a measurable quantity for the astronomer with his methods of prechion A shift toward the violet means that the waves are crowded together and the star is approaching the earth, a shift toward the rear end of the spectrum sig-nifies that star and carth are separating from each other A measure of the shift gives the velocity of the star in miles per

The calculation of these velo the line of sight is now a great, fruitful field of astronomical research and many 64,000 field of astronomical research and many important developments have been made and it. It is a far cry from the small of the spectroscope that is ordinarily used in a sea constant of the spectroscope that is ordinarily used in a sea constant of the spectroscope of the spectroscope and its refined spectroscope. OAR 346 Yerkes telescope and its rafined spectro out set graph (Sciknrivic American, December 25th, 1909) This required not only vast improvements in the instruments them-selves but in methods all through as well improvements in the instruments themedia of the control of the con due more to Frot W W Campbell, directions to the Lick Observatory, than to any states of the Lick Observatory, than to any states of the man He has been a leader in all green and plant of spectracepts work, and his safety methods are largely followed wherever and the safety with the same largely followed wherever the are statempted, such as safety spectrum shows remarkably likewise and the safety spectrum shows remarkably likewise safety spectrum shows remarkably likewise safety spectrum shows the safety sp

(Continued from page 170)
lons a photographic plate 12/3 x 4 inches some faint strenks of light about two inches long and possibly on sixteenth of up inch in width. This tells the whole story of the stars motion. Asturally this photograph is placed under the int rescove for examination and there it as pears magnified and is measured physical constitution of the Star the me tals that compose it is known from the lines of the stellar spectrum, hydrogen from instance showing its badge by a series of prominent lines. The motion of the star is shown by the placing of these lines, whether they are shifted from Ilmen, whether they are shifted from their hormal position as kiven by the comparison spectrum to the violet or toward the red end of the spectrum. If there is hydrogen the the spectrum of these of the hydrogen comparison spec-trum give the position of rest or sero-volocity with respect to the earth, and the amount of the shift measured under the microscope show the moster of the the microscope gives the motion of the trum of the star (as is usually the case) from of the star (as is usually the case) we can readily in an analogous fashion measure the motion. The photographs in the illustration were taken at the Yerkes Observatory with the great 40-inch telescope Two separate spectra are there shown taken but three days apart on lanuary 5th and 5th 1966. The star spectrum appears in each between the com-parison spectrum of Hanium and it is widened to make the lines more prominent and the whole greatly enlarged. The violet end is toward the left, red end to violet said is toward the left, red end to the right. Portions of the comparison spacers on both are cut away to bring the two closer. The numbers on the top give the wavelengths. Notice that all the lines in the lower spectrum are shiftto the comparison lines than in the upper spectrum. This is specially noticeable at line 4501 and better still at 4481. A measure of the amount of these shifts gives the radial velocity of the star with respect to the earth. The variable ve-locity in the line of sight of this star shows it is not a single star but a system Measures made by the writer on the star  $\beta$  Trianguli show the following results where the radial velocities are given in miles per second relative to the sun. The plus sign means that the star is increase ing its distance from the sun and s minus sign that it is moving toward the

1909--Bept 7 Sept 8 Bopt, 18 + 31 miles per second + 31 miles per second - 5 miles per se cond Ort 5 Ort 12 + 1 mile per second | 20 miles per second + 18 miles per second

The measures must be carried out with ntmost care. If the spectrum of the star numericare It the spectrum of the star is good with many well defined lines, the radial velocity (i e toward or away from us) may be determined to an accu-racy of one-to-thic of a mile per second Think of this when light travels at the rite of 186,000 miles per second wher six hundred millions of millions of waves enter the spectroscope every second and when in addition the star is so far dis iant that fix light even when traveling hundreds or thousands of years to reach us! To contemplate it makes our minds whiri at the enormity of space and causes us to how down in reverence to the wonderful human intellect that car solve such problems!

note and pronous.

Investigations of certain stars show us that at one time it may be moving toward our sun once in a few days or weeks the direction of motion may be reversed and it is traveling away from the sun. The star of itself is unable to change its mu-tion, and another body must be present

WHEN WITHOUT STORY STOR

arately, and hence we have a compara-tively are close of stars, those which ap-pear as single even in the most powerful telescopes, but whose motions in the spec-trescope show that they are really double smar. These are called proctrascopic binaries. Recent researches at the Link Otherystory, Terbas Otherstory and other places bring to our knowledge most starting results. Imagine to re suns each many times more massive than our many times more massive than our own, rapidly revolving about each other in a few hours! In addition to this comes the fact that at least one in every few stars so far investigated turns out to be not a single star but a system, and it bas become necessary to reconstruct our ideas regarding the importance in the universe of this small ball which we call Mother Earth.

#### Dying Pearls,

The last array of earlies the part of the

the controlling forces of society, by age and industrial minfortune, as well as by infancy, congenital incapacity, and weak-

The middle-aged and the socially inom-cient now form a relatively larger section of society than ever before There are two reasons for this The first is, that while there may not be as many children born now as formerly, among cartain people, of the number born a much larger portion reach maturity In other words portion reach maturity. In other words, the ratio of adults to a given number of births has increased. The second reason is that modern business methods and the modern corporation, especially the manu-facturing corporation, have created new rouditions and complications. They have added to those who join the dependent classes under a simpler life, those who become dependent because their active lives have been devoted to highly spe-

ialized work. Highly specialized labor is con Highly specialised labor is constantly menaced by loss of occupation, and this menace increases as the age of the worker advances. Under the figure competition (Continued on page 172.)

An average American knows many people. But he does not always know where they are.

He has a thousand friends and acquaintances. Where are they at this particular moment? He can be sure of some of them-perhaps a dozen. But he wants to locate one or more of the others.

The Bell system enables him to reach them.

If he finds his friend at home, or in his place of business, he talks with him at once. If helearns that his friend is in some other town the Bell System will furnish the connection.

Cities are larger than they used to be. Men know and need to know more people. Yet the need of keeping in touch is as great as ever. Without Bell service there would be hopeless confusion

The range of the telephone is not confined to one town or one community It is not satisfying simply to learn that a man is out of town; through the Long Distance Service of the Bell System he may be reached wherever

The Bell Service extends to all communities. It reaches the milltons of American people. One in twenty is a Bell subscriber. The other nineteen can be found, because Bell service is universal

The telephone does more work for less money than any other servant of mankind. There is economy as well as efficiency in one system, one policy, universal service. Every Bell Telephone is the Center of the System.

(Continued from page 17.) which governs the greater portion of our industrial life, new processes, new methinventions, are all eagerly sought by the nventions, are all eagerly sought by une mployer of labor. Some of these are svolutionary in their effects. They call or a readjustment of the whole plant When that readjustment comes, the older men are invariably dropped. In short, the avenues which lead to employment, for all highly specialized labor, are pracfor all nighty specialized indor, are prac-tically open now only to youth. The middle-aged man enters with difficulty and the man past middle life substan-tially cannot enter at all. The man who did many things, none of them highly specialized from twenty to sixty five, is likely never to become entirely dependent upon society. The man who did some highly specialized piece of work which involved only a part of some specific thing, or even a part of a part, n ed into the dependent class before he reaches old age, and when he joins that class he is much more helpless than the nan who has done many thirgs. It is probable that the specialist, altough he labored fewer years, rendered society the more valuable service of the two, and that therefore he has, morally at least, a that therefore he has, morally at least, a clearer title to consideration. But have ever that may be, he is the inevitable product of the whole plan of society and business, and the obligation of the man who employs him and the interest of eral society in what finally beco of him, are clear and unavoidable class must be shown how to protect itself against the menace which it con stantly faces or that it must be helped outright after disaster or age come are

There can be no question that a system which teaches these people how to tect themselves against this menace more in harmony with the genius of our institutions than a system which coerces them into action or a system which final ly places the burden of their support and care upon general society. It does not follow that a system which works well in Gormany would work well here, or that a system which appeals to the needs of the people of Great Britain will answer here. There are distinct advantages in the German plan,—chiefly that it is com pulsory and that the laborer is forced to make provision for certain benefits though he may have no very intelligent understanding of the wisdom of the plan or its effects on society. There is a dif-ference between the compulsion of gov ernment, which tells the workingman that ertain thiuss must be done. and the sition of a corporation which tells a man what the conditions of his hiring

connelling facts in the sociology of the

If the conditions named by player involve some system of life insur-ance some system of deferred annuities, a man can study the question and take a ommends itself to his judgment or other ommends their to his judgment or other wise. This is a slower process than the German method and probably for a good many years will be more expensive, but it seems to me to be in harmony with our notions of individual responsibility and the rights as well as the obligation Ametican citizenship

The efficient employee, in specialized labor, has a fair claim to something be nary contract of hiring This right may be strengthened and its realization advanced, but it cannot directly be met, in this country, by governmental action The capable worker deserves and should lemand a programme of hiring under by contract not by the grace of his om -to certain protection for his fam ily if he dies prematurely, and to certain protection for himself if in the vicissi-tudes of industrial war he is shelved and wholly or in part compelled to join the dependent class

There are sound reasons why corr (Concluded on page 174)

ork of the highly developed system of responsible insurance institutions of this and of other States. Any effective sys-tem if established by corporations inde-pendently, will be based on the principles and methods used by the insurance com-panies, and therefore the work for ob-vious reasons is in the end likely to be more effectively and more economically does by mer who are vertex and asmore effectively and more economically done by men who are experts and spe-cialists than by men who undertake it with no special training and with minds chiefly occupied by the demands of other

(Concluded from page 178)

I shall therefore assume that life insurance, and probably other types of in-surance including accident and sickness insurance, as represented by existing cor-porations is not only well equipped to help in the solution of this problem, but is a part of the evolution of the times which has produced the problem itself, and is another illustration of the curious fact that in the processes of evolusolution of a problem often appears the same time the problem itself is evolved For example, what might have happened in the enormous industrial happened in the enormous industrial activity of the United States and its necessary output of securities seeking purchasers if millions of people combining their small savings in the reserves of the great life insurance companies had not appeared upon the scene contempo not appeared upon the scene contemporareously seeking securities in which to invest their money? The function of life insurance and of other types of insurance on the one hand and the obligation of the employer of labor to his employers on the other, bear, it seem to me, an identical relation

latentical relation

Life insurance is already effectively at
work While the employer of labor has
only in the most limited way used the
idea or appreciated its beneficence, progreas has been made toward the solution of this problem Eliminating industrial companies and including only those com-panies whose business is supposed to be confined to people of means, we find the confined to people of means, we must see average policy the country over is a little under \$2,000 In other words the mass of so-called regular insurance is held by people of small means. If now we add to these the millions who carry what called 'industrial' insurance, and called 'industrial' insurance, and the other millions who have so-called "fra ternal' insurance we have covered sub-stantially the whole insurance field. We comprehend an interest whose accumu-lations surpass those of any other single-line of human endeavor except the ac-cumulations of savings banks, and yot wo have not gone outside of what may erly be called the laboring class erry be called the laboring class. The energy of life insurance management, in other words, and the obligation which the laboring man feels toward his family have in their development far outrun the sense of obligation of the employer We ployer is beginning to do his part—but as yet he has only made a boginning. That he will do more is certain, that he will do That much is almost equally certain. That existing insurance institutions will be utilized is, I believe, a necessity

Alloys Formed by the Compres Metal Powders,

The ordinary method of preparing al-The ordinary method of preparing al-loys consists in meiting two or more metals together, and allowing the meit to crystallise after cooling. Can not the same alloys be obtained by compressing the component metals at ordinary tem-peratures in the shape of fine powders! Dr W Spring showed as far back as 1832 that under a pressure of 5,000 atmo-spheres the powders of the constituents of the Rose and Wood alloys will form of the Rose and Wood alloys will form conglomerates, the melting points of which nearly coincide with those of the alloys obtained by molting in 1338 Hal-look showed that by mersy in 1358 Hal-look showed that by mersy in 1358 Hal-tod that by mersy in 1358 Hal-tod have pressures the powders of the same constituents there is obtained a mixture (Concluded on page 176.)

ponent By compressing zinc and copper powders, Spring obtained a conglomerate which was distinguished from brass only by its slightly darker color

by its singitly darker color in spite of these partial results the problem had not so far been definitely solved it remained in fact to be seen whether, by augmenting the speed of fusion of the mixed metal powders, prossrussion of the mixed metal powders, pressure really favors the formation of those compounds which are characteristic of alloys obtained by molting This question is answered by Prof G Tamman on the basis of recent experiments by G Massing. Masing

When submitting a mixture of filings of two metals forming neither a chemical compound nor mixed crystals (e.g., zine and cadmium or copper and silver) to a pressure of 4 000 atmospheres, and heat pressure or 4 own atmospheres, and near-ing the conglomerate thus obtained the rising curve of temperatures is seen at a given point to slackon down after reat-ing a temperature 10'4 deg C higher than that at which the whole is found to As far as its thermal properties and its atructure are considered this conglomerate is practically identical with alloys obtained by melting

Again by compressing under high pressure the powders of two metals forming a definite compound and capable of mixing in all proportions in a liquid cou-dition and by heating the conglomerate thus obtained, two stopping points are found in the curve of temperatures first of these points corresponds with the melting of a compound formed at the sur face while the other corresponds with the formation of the alloy. This is the case for instance, with mixtures of magnesium with zinc lead tin or bismuth. The conglomerate composed of magnesium and giomerate composed or magnesium and antimony has only a single stopping point situated at 300 deg C below the melting point of antimony This corresponds with the formation of the compound Mg.Sb. The temperature then rises

rapidly in order to eventually fall down to the melting point of the alloy. The to the conglomerate of two metals forming an uninterrupted series of mixed crystals, such as magnesium and cad mium on the one hand and lead and thal conglomerates only a single stoppin point is observed corresponding to th point is observed corresponding to the melting point of the most fusible com-ponent. The form then assumed by the curve depends on the diffusion of the two components into one another. The conglomerates obtained merely by

compression do not contain any trace of mixed crystals Microscopical examina tion thus only shows the existence of grains of copper and tin in recently pared conglomerates If, however these mixtures be heated to 200 deg C (i e, below the melting point of the tin) there are found between the grains of copper and tin, two layers corresponding to the compounds Cu, Sn and Culin respectively If these conglomerates be heated during 20 hours to 400 deg a layer of mixed crystals, corresponding to the formula Cu<sub>3</sub>Sn, is found. This proces that com-pounds of these metals are permeable to

The following conclusions are

om these experiments The compression of two m nary temperatures will yield conglomerates containing only the pure metal 1 e neither compounds nor mixed crystals as wristle of alloys obtained by meltcharacteristic of slicys obtained by met-ing. Mere compression thus does not activate diffusion sufficiently to bring about combination or the formation of mixed crystals if, however, heated met-als (i e., with increased speed of diffu ais it e., with increased speed of diffu-ation) are submitted to pressure there is obtained not only a more coherent mass, but a portion of the metals is found to form compounds and mixed crystals, so as to produce a conglomerate which is very much like a real alloy

melting at a lower temperature than the melting point of the most faulthe com-

#### THE COMMISSIONER OF PATENTS' ANNUAL REPORT

HE annual report of the Commissioner of Patents Hon Edward B Moore, for the fiscal year ending June 10th, 1909, has recently been published and contains several useful suggestions for the improvement of the office of value to inventors and natentees

to inventors and patentees
Referring to the work of the office, he says
There were received in the last fiscal year 62 800
applications for mechanical patents 1 188 applications
for designs, 192 applications for releases 2 052 caveats 7,509 applications for trade-marks, 1,001 applications for labels and 138 applications for prints There were 35 215 patents granted including relasues and designs and 4 547 trade marks, 779 labels, and 231 prints were ed The number of patents that expired was The number of allowed applications which were by operation of law forfeited for nonpayment of the final fees, was 6,763

"The applications for patents for inventions have "The applications for patents for inventions have increased over last year by between 4,000 and 5,000 cases. The applications for trade-marks, however show an increase of only 42. The number of trade-marks registered shows a decrease of 1,598.

"The 'act to amend and consolidate the acts respect-ing copyrights," which was approved March 4th, 1909, hich became effective July 1st, 1909, repeale act approved June 18th, 1874, under section 3 of which act approved june 18th, 18th, unner section 3 of water labels and prints have been registered in the Patent Office Consequently no certification of registration of labels or prints have been issued since July 1st, 1909, except those pridancing registrations effected, on or beexcept those evidenci

"The money receipts from all sources ware \$1,975,-919 97, and the expenditures \$1,887.443.35, leaving a net surplus of receipts over expenditures of \$88,476 83 The grand total of receipts over expenditures for main ng the bureau from 1836 to date is now \$7,060,547. This vast sum represents the earnings of the Patent Office, and the bureau is therefore more than self-sup-

Owing to his success in securing additional appro-priations from Congress in 1908, the salaries of the praktions from congress in jow, the samines of the examining corps were increased on July ist of that year, resulting in a noted decrease in the annual resignations. Owing to the additional force he was authorised to employ and the ritention of the skilled szaminers, the work in nearly all of the examining. divisions of the office is practically current to keep the work current in all branches of the office. if po ible, which is certainly a most laudable pure, and one that should be carefully considered by Congress He says

Congress He says
"The rapid increase in the number of applications
filed and the constantly increasing field of search embracing as it does not only United States and foreign
patents, but also publications of every character, make
it imperative that additional force be provided each

year to prevent accumulation of the work."

He has asked for one new principal examiner and twenty additional examiners to further the work of lassification of patents. There are now 930,000 United States patents, approximately half of which have been reclassified Over 2,000,000 foreign patents and nearly 90,000 volumes of the scientific library remain

The models formerly stored in the basement and on the first floor of the Patent Office building have been moved to another fireproof warehouse a short

Additional space for the storage of new volumes of foreign patents by at least 150 linear feet per an num should be provided for in the office library An

appropriation of \$2,000 for this purpose, which it is thought will be sufficient for a period of five years, is

recommended
The space available for the storage of printed classified copies of patents is becoming crowded and the
acrommodations in the atterneys' and public search
room are becoming insufficient for the work done there One of the long hallways that has bee apart for this purpose is in a congested condition is inadequate for the purpose Some changes to afford temporary relief are suggested by remodeling the basement on three sides to conform to that of the Ninth Street front

He believes that the time has arrived when measures should be taken to secure the construction of a new larger building in which ample room will be afforded to properly and promptly transact the bust su of the office. He save particularly

"It is necessary that patents for new inventiona-should be issued with the utmost promptness after the should be issued with the utmost promptness after the application for patent has been filed for such inven-tions form the basis of vast industries, which inure not merely to the profit of the inventor, but to the benefit of the manufacturer the laborer, the trader, the professional man, and the consumer, and to the commer-cial interests of the country in general Great Britain and Germany have each recognized the necessity of providing ample facilities for the work of their patent bureaus, and have each recently erected new buildings for their patent offices, which are in every way more commodious and better adapted for the business of a patent office than the building which now houses the United States Patent Office, although the patent bust each of those cou pared with that transacted in the United States Patent

He urges that the new building be located near He trigger that the new building be located near the Congressional Library on a square north of that building as embodied in Senate bill No 1,864, intro-duced by Senator Daulel, January 24th 1888 The surplus to the credit of the Patent Office in the Treas-ury Department of \$7,086,847 he thinks would go far rd paying the expen se of the building

As to future desired legislation he continues his endation in previous reports by advocating an amendment to the statute which has for its object the rtening the course of appeals from the primary examiner (in . x parts cases) to the board of examiners in chief and the Commissioner by combining the board of examiners in chief with the Commissioner of Pat or examiners in enter wint into Commissioner or ra-ents and his first and second assistants into a singli tribunal, any three of whom shall constitute a quorum to which all appeals shall lie, whether from a primary examiner or from the examiner in interferences and from which appeals would lie to the Court of Appeals from which appeals would lie to the Court of Appeals of the District of Columbia The elimination of one appeal, he states, would materially shorten the time required for the ultimate disposal of appealed cases and effect a considerable saving of expense to appli-We believe there is much merit in this reco mendation and trust it may receive favorable consid-

A further additional provision recommended is the amending of section 4 889 of the patent law by re-quiring to be filed with the drawing two photographic copies thereof with the application. One of the photographic copies is to be kept in the file wrapper and the other is to be filed in secret archives in charge of the chief draughtsman while the drawing itself will be kept constantly in the office of the examiner and will be available at all times for inspection in their re-spective divisions He states there have been cases spective divisions 110 states there have been cases of fraud in withdrawing and substituting other draw lags for the originals and that some such plan is needed to detect possible unauthorised changes We think it would be more practical for the Com-

nissioner to have the negatives made of the drawing at the time the application is filed, and withhold the delivery of the filing receipt until the official photo-grapher had certified the photograph as being an exact reproduction of the drawing
The Commissioner advocates the form

'patent bar," and suggrests before an individual be permitted to practise before the Patent Office be will be required to pass an examination as to his moral, ical qualifications before a con appointed by the Commissioner of Patents, composed appointed by the Commissioner or Patenta, composed of officials of the office and putent attornays of well-known standing in the profession, who shall conduct the examination under the direction of the Commissioner The report of the committee is to be subject to his approval. This suggestion appears to us to be very appropriate

In regard to the amendment and improvement of treaties with other countries concerning industrial property, it is proper to say Commissioner Moore has been most successful in securing advantages for Amer-ican inventors. He says on this subject

"I am gratified to report that during the last year a treaty was negotiated with Germany, which confers great benefits upon the American inventor. The patent laws of nearly all the foreign countries contain a clame providing that it as investion is not that is, manufactured or practiced—its such country within a certain period, ranging from two to four years, the patent may be annulled. This treaty with Germany norther than the second of the sec years, the parent may be annuared. This crossly was fermany provides that the working of a patent in one of the contracting countries will have the same force and effect, so far as avoiding the revocation of the patent is concerned, as if it had been worked in the country in which the patent was granted. This treaty ctically assured to American inventors the prohas practically assured to American inventors the pro-tection of their rights in Germany during the full period for which the German patent is issued, con tingent only on the working of the invention in one of the two countries

"It is understood that Sweden has modified its laws to extend similar protection to other countries wh do not require the working of the invention within a specified period, and negotiations are now pending with nearly all the European states for the promulgation of treaties of the same character. In order to asist in the negotiations of these treaties, I have delegated by the Department of State, and with your permission I shall visit the capitals of several foreign nations to assist, so far as within my power, in the otiations of such treaties, which if concluded will greatly extend the protection of inventors, manufa ers, and the industrial interests of this country, as well as those of the nations with whom such arrangements may be made

ites the next International Convention for the Protection of Industrial Property is to be held at Washington, D C, in May, 1911 About this he is most sanguine and enthusiastic. He save

meeting of this convention is most in to the interests of the American inventors and many facturers. The 21 nations which are adherents to this union will be represented by delegates having full ower to negotiate agreements in respect to the re-procal protection of patents, designs, trade-marks, ciprocal proand industrial models, which when ratified by their respective governments will have the force of treaties. The efforts of these conventions in the past have been crowned with success the agreements relating to the reciprocal protection of patents and trade-marks having been ratified by all adherents, which comprise the leading commercial nations of the world and the Con gress of the United States has in each instar ed the patent laws of this country to accord with the terms of the international agreen these conventions

Not only are the memb t only are the members of the union represent legates but all other civilized nations, not m by de bers of the union, are invited to send representatives in the interest of furthering the reciprocal protection of industrial property. It is expected that at this com-ing convention a strong effort will be made to harmonise the laws relating to patents and trade-marks throughout all countries in such a manner that ade-quate protection will be given to an inventor, no mat ter of what country he may be a citizen, without the necessity of obtaining expensive patents in each of necessity of obtaining expensive patents in each of the several countries in which his invention may be used or sold. It is also proposed to perfect and extant the international registration of trade-marks and thus further the reciprocal protection of commercial indus-

#### THE ALL-STREE CAR THE CAR OF THE FUTURE

OR many years past the Scientific American has strongly advocated, on grounds of public health and safety, the building of all-steel cars for railroad service, and we are there cars for railroad service, and we are there froe much gratified to learn that the Pennylvania Railroad Company is adding to its steel-car equipment at a rate which promises, before many years, to elimi nate the present woodon ear, and provide that great system with an allested passenger car equipment is was on August 12th, 1964, that that railroad, an onunced that all future passenger equipment would be built of steel and that the design would be such as to render it indestructible either by collision or fire planning the cars and establishing those stan e stand yearning the curs and establishing those standard types which are now being copied in all the new equip-ment, no expense has been spared to build a coach which should provide the greatest possible strength. and finish it with an inside lining that short and min it win an inside litting that should be ab-solutely unbornable and possess the added and not inconsiderable advantage that it would be a poor con-ductor of heat and noise. The first order, placed in November 1906, was for 100 cars. Subsequent orders have been given, and there are now in service \$45 coaches, 10 dining cars, 21 combination passenger and baggage cars, 29 baggage cars, 18 postal cars, and 1 company car, making a total of \$24 steel cars, thermore, the Pullman Company has been build: ag for toermore, the Funnan Company as been summing for the railroad during the part four years some all-steed parlor and sleeping cars. About 500 of these will shortly be placed in service With the present steel eculpment and terms 350 cars to be ordered during the present year, the Pennayivania railroad will in a short while have in service 900 of the own steel

# ENGINEERING.

In a paper recently read by Mr Henry Hess before the American Society of Mcchanical Engineers on the power lost in being, it was shown that 50 per cent of the power transmission jest was due to journal friction. This may be materially reduced by substitution of ball for plain bearings, provided care be taken to sutt the size of the balls to the load.

The Committee of the American Railway Mainteesectway Association in a recent bulletin takes up the subject of rail specifications. For Beamers rails of \$5 to 100 lb. it recommends the following composition Carbon, 045 to 055, manganese, 085 to 115, hopepherus not to exceed 010, and sulphur not to exceed 0075. The recommendations for open-bearing test for the same weight of rail, carbon, 085 to 076, manganese, 078 to 100, phosphorus not to exceed 004, and sulphur not to exceed 008

The two latest German dreadnoughts are to be equipped with turbines, and special luterest attaches to the fact that two rived types of turbine, the Parsons and the Curtie, will be tried out against sach other The "Heindal" will be propelled by triple serves operated by Curtie turbines, and the sister why will be equipped with Parsons turbines of equal contract

A method of simultaneously excavating and lining vertical shafts is contemplated in one of the contracts for the Catabilli water supply. In the shaft will be suspended a lining platform, from which but concrete forms will be erected and concrete little. The excavating will be carried on below, the material being loisted through a hole in the center of the plat

norm. The weekly noded in these columns the mold in crease in the weight of too monitors. A similar proverts to the property of the property o

Apropa of marine turbines we note that Messre Persons & O., recognizing the advantages of twinserow propulsion, as proved in the Curtis equipment of the scott 'Selsem', have developed a modified curtis partial admission turbine which they are to install in one of the new \$500-ton 28-kmto Hirthis scotts. A turbines will weigh 340 tons, and guaranter soll prover on 13 pounds of dry steam per horse-power per heur. The Curtis turbines will weigh 250 tons and guarante 125 pounds of superheaded steam

There are persistent reports that the Hamburg American Line is about to build two huge steamers which will rivel the White Star liners Olympic and Titanie, which are to be in service during 1911. The reported dimensions are Longit, 560 feet, Neam, 92 feet, and depth 66 feet. Reciprocating outpines of 46,000 knore-power will direct the align at a speed of

A recent bulletin of the United States Geological Survey give some statistics of producersys power plants in the United States which are very favorable There are over 500 plants in operation, aggregating, 115,000 horse-power The government teating plants at 8t. Louis and Norfolk show a fuel consumption of as low, under favorable conditions, as 055 pound per electrical horse-power Comparative issis of 75 grades of bituminous coal under steam hollers and in producers show a ratio of 37 in favor of the latter

One of the meet important branches of the general schema for the development of Japan is the extension of her railroad development along predetermined lines which have been laid out with an eya to the development of the event in this development was the recent completion of the railway between Historehi and Kageshima, which connected up the last like in the trunk unknown of the trunk of the trunk of the trunk of the lain of the major which connected up the last like in the trunk in the country of the lain of the lain

A premising installation of a windeallishectric also premising installation of a windeallishectric production of the production of the production of the lands by J. G. Childe & Co., of London II toosistes of a 24-foot wind turnise carried upon a 75-foot tower. The generator is located at the foot of the tower, the bestery and writeholoard in one of the outstallings or the house. Overhead copper cables carry the currant is the heatery some 657 pred datasit. The generate is the heatery some 657 pred datasit. The generate is directly some 657 pred datasit of the generate is directly some 657 pred datasit. The generate is directly some 657 pred datasit. The generate is directly and the production of the pred to the pred to the pred to the pred to the wind turnishe. It has a fauntimen capture of 4 kilowatta with a neemal presence of 70 volts. The plant runs about 100 lights in the beness, and serves also to drive a charf outlow, a circular saw, and a rootpulphing machine.

#### ELECTRICAL.

A company has been formed in London to introduce and encourage the use of electricity in the poorer distircts of the city. The company agrees to wire and supply any apartment of three rooms and over with statulum lamps, charging five crats a week per lamp from April to September and seven cents a week for the rest of the year. The lamps however must be renewed by the consumer.

A new mounting for nestallic filament in lamps has been devised in Germany. The mounting provides to the shrinkage of the filament which is not always uniform, and for this reason each filament is supported at its lower end on a small spring which is overed with a paste of finity powdered tungstes so as to prevent it from being consumed by the heat of the incendescent filaments.

of the incendescent filaments
The use of the telephone for train dispatching is
alowly appracting The Gulf, Tozas & Western Raliroad is equipping its line with a telephone system for

payable-altestes plant in the listone Mountains about 38 miles from Neiobnam, Ispan has revently been completed and is particularly interesting for the first that must not the apparatus used is of Japanese make. The Shibaura Ricetric Manufacturing Company of Toklo has built the 60-kilowest air-coled, oil immersed transformers to b. used at the substantion in Volchama. A large number of the high tenden of About omethird of the line is supported on towers which is a new departure for Japan At the power station the water is carried over a distance of 1 1000 generator units in upper half of the tiple lines consists of riverded pipes made by the Shibaura Company and the current which is generated at 3.50 voits, is stopped up to 8.6000 voits for the line.

In a resear number of the Electrical World appears an interesting article on the wireless telephone and the author arrives at the following conclusions: it is, then quite evident that fruit respairs of wireless telephony must either eliminate the one of these used today. In addition to this, some more of these used today. In addition to this, some more stituted for the art if no grant difficulties arise in its operation and its cost be sufficiently reduced this usualitated may be the high frequency alternator With the few weak points of the present system related, the wireless telephone will come into all the moved and the usuful parts of the appearance related, the wireless telephone will come into all the defects will increase a construct from present method until these are discarded, attempts at commercial wireless telephony will be frative.

The following useful electrical shop kink was judished in a recent number of the Slectric Railway Journal describing a method of soldering broken or burnedout vires without removing them from the armsture "The danaged wire is raised a little way out of the sold. The insultation is then arraped off for a few inches and the ends of the broken wire arrested off smoothly after which a place of wire is cut to fill the gap One and of the inserted wire is then obtained with the armsture wire and the ends heated by the gap of the second of the inserted wire is then the second of the place of the second of the inserted wire is then the described between the second of the inserted wire is then controlled the second of the second o

It is reported that at the time of the receive of the seamally "Kontucky" by the "Alamo," which had been summoned by wireless telegraphy, the writess apparatus had almost been put out of commission by the water that partially submerged the dyname. By wrapping the dyname may be a summoned by wireless apparatus that partially submerged the same than the same of a rescene due to the help summoned by wireless relegraphy, and on a previous occasion the suparatus was put out of commission by the encrear-lineates of the water. It has been suggested that storage batteries should be used to supply the current, because they could be justed that storage batteries would be impractical owing but a storage batteries would be impractical owing to the motion of a vessel in a storm, some arrangement should be provided for placing the dyname and agasotice engine for driving it well above the danger

#### SCIENCE

Recent experiments have proved conclusively that coal dust which has been ground to a state so face that it will pass a 200-mesh sieve, will explode from contact with either a naked flame or with the arc of an electric current.

The building of an observatory on the rim of the great crater of kilausa has been advocated for several years. The prospects are now brighter than they ever were, and it seems likely that the observatory will be built as part of the follogs of Hawaii

A recipe for a non-shrinking alloy to be used in duplicating nations, is given as follows by The Metal Industry Tin, 50 pounds, sinc, 50 pounds This gives a tough hard metal that runs well if a good rated of rine is used The addition of 2 pounds of binsuits will render it even more fauld and enable it to be pound at a lower temperature ity using his to spread pounds of the shrinkage which is slight, may be largely overcome

Prof. 20 Bearand recently obtained a photography of liality's come showing a tail our degree long. The comet is beginning to wake up. Mr Ellerman will sail for Honolulu on March 38th to observe the transit of Itality a comet across the sum's disk. He is sent out by the comet compittee of the Autronomical and Assembly the comet compittee of the Autronomical and Assembly the Comet Compited with the Compited Compited

During the night between 0 toker 7th and 8th, 1989, a meteoric atoms fell to earth on the farm of W. P. Nikkerson, of Norwood Mass: The meteorite is a Manushaped mass of very hard gray stony material, nuch corrugated on the surface, about two and one-half feet long in this greatest dimension one foot to nearly one and one half feet long dark daying from section to extend from the thrift dimension. Its own foot to overshift fout in the third dimension. Its weight as perhaps 275 pounds, and its dranity as not much over 2.5.

Besides Halley's Conict two other comets may be expected in 1910. The first of these is Tempel's, discovered July id, 1971, at Milm: It has a period of 575 years. It was observed in 1873–1894. 1899. and 1904. It has passed perficilion in November. It ought therefore, to be expected this spring.

The second of the expected comets is that of Arrest, discovered in 1851 and the return of which is expected in the summer of this year. It was observed in 1877, 1870, 1877, 1870 and 1807. It was unfortunately placed in 1804 and therefore could not be observed.

The shift purpose of the semal proof room at the lutherwisty of Dunks in the insuring of perfect free dom from sounds from outside its building it on philatorss of thick lead and co-most and by controlled in its walls of many thicknesses of fell, cork, abselved, and other bed conductors of sound vibrations, and other bed conductors of sound vibrations, on the controlled conductors of sound vibrations that the beating of one's mucles in at once heard on taking up a post of the controlled controlled in the controlled controlled in a submoving or of sounds only defect of it as a laboratory for acoustic experiments is tast verification is absent, and no one can remain in it for more than a hour at a time

Prof. Lipmana announced before the Academy of Sciences that Mustume Curle has obtained a tenth of a gramme of polonium with which she has been or perinenting. Polonium is a ratiosective element discovered by Madame Curle as early as 1885 but not of old the control of another body.

A special investigation of the motion of the bridge of the violin has been made by 1 W tilliar and TYP M De Itaas of Amsterdam. They conclude from their M De Itaas of Amsterdam. They conclude from their parallel as well as a transverse motion, and that the indirect of a violin performs a parallel as well as a transverse motion, and that the indirect of the motion is altered and the other tender of one of the motions is altered and the other have also explained the action of the motion and the In finance which the use of too thick or too thin a bridge has on the sound of a violin. The mute is commod purposed to "dampen" or "deaden" the sound. If the mute caused nothing but a general damping by reducing the bridge motion, the mute would only weaker the section of the state of

# A NEW TYPE OF SELF-DISCHARGING COALING VESSEL

BY F. C. COLEMAN

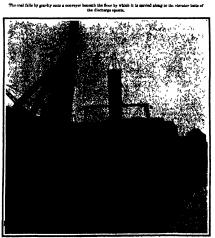

The new system of belt-conveyor discharge has been The new system of belt-conveyer discharge has been installed by William Dorford & Sons, Ltd., in a new vessel—the steamship "Fallion"—which they have recently built at the Pallion shipyard, Sunderland, England, to the order of the Dunrobin Shipping Comof Newcastle-on Tyne This ve length between perpendiculars of 270 feet, and a tength between perpendiculars of 210 reet, and a carrying capacity of 3,100 tens on a 17 fee, 10 faches draft. The machinery, comprising triple-expansion engines and multitubular boilers is placed aft. The cabin accommodation is fitted in

the bridge and the crew space in the forecastle, while the navigation accommodation is about midships accommodation is about midships The inner bottom is raised and sloped upward in the wings and built into the sides of the vossel forming a suitable incline for gravifating the eargo to the con resinanting the cargo to the conveyers, and also giving the vessel the advantage of being about half loaded when in ballast and bunkers. In the center line is constructed a slope-top fore peak throughout the hold and between tunnel and the tunnel extend ing from the engine space to the raised portions of the double bot of the Robins pattern one on either side of the vessel The sides of the tunnel below the level of the hatchways over the belts are open for free access to the belts and carriers at all times. Over these carriers at all times Over these conveyor belts are placed strong iron guide plates extending the full length of the hold and par-tially covering the belts leaving a 24 inch hatch over a 36-inch belt This space is covered in the holds by cross-laid batch covers, 9 inches in length and 3 inches in thick ness, which support the cargo and leave the conveyers to work with out carrying the load At the after end of the hold a portion of the hatch, over which the 9-inch hatch er is omitted is covered by a ntal fron slide door opera by a ratchet in the tunnel On the ide of the bulkhead is con structed an access chamber in free communication with the tunnel which is of such a form as par-tially to protect the slide door from the cargo when loading, and in the floor of this projection of the chamber is fitted a flap hatch to give access to the hold from the tunnel At the after end of the cargo space the conveyers rise from the horizontal and pass up-ward in iron chambers through the machinery space, and thonce into the conveyer-driving engine room shoots in the stern of the vessel These carry the load on to return belts, which are extended forward beits, which are extended royward both sides on the deck in a sim-ple form these conveyers would terminate at the fore end of the machinery space, or poop front and the load would be delivered and the load would be delivered into side shoots which telescope and are adjustable for loading barges on either side of the vessel, the shoots being suspended from derricks or other suitable means. defricas or other suitable means, in cases where the discharge is required at a higher level than is attained at the poop front and a large range of elevation is necessary, as for instance, for delivery

on high quaye into trucks and into barges alongside, the conveyors are carried forward and hinged at the poop front, and the delivery end is sus-ponded by suitable tackle from twin masks or framework, and is raised or lowered according to circum-stances, delivering the load into telescopic abouts sus-pended therefrom When the delivery is into trucks, the "offside" beit delivers amidships into a cross cost veyor suspended on the masts, which carries the load to the shore side and delivers by shoots into the tracks. A development of this principle has, however, been

applied to the steamship "Pallion," as, in order to obviate the use of delivery shoots, which results in considerable damage, the terminal conveyors are carried in swivel booms, which are raised or lowered and swung overboard to the points of delivery, thus perswung overcoard to the points of celevery, thus per-mitting of the cargo being conveyed direct to the truck or barge without shoots. These booms may also be awang across to the reverse side of the vessel, so that both booms can deliver simultaneously into trucks or an deliver simultaneously into trucks or
Another important feature of this dis-

View of the hold

The roal is taken from the bottom of the bold and discharged at an elevation of 40 feet above the water by conveying and elevating botts operated on the ship. Rate of unloading 200 tone per hour, cost two contra a ten. A NEW TYPE OF SELF-DISCRARGING COALING VESSEL.

charging arrangement lies in the method of delivering the cargo onto the belts from the hold, and anabiting the operator to have full centrel and free ascess at all times to the conveyars and to the fice of the cargo. He may thus superistend and direct the continuous flow, and be in a position promptly to correct any tend-estery of the cargo to bridge or to shelp, the aperture seeding to the belt, which, being the samplest space the load has to pass through, insures a ophitmores and un-interrupted collivery.

The unloading of a carge of coal is carried on as follows Presumably the holds are full and the carge lying solid, except under the overhang of the chamber on the bulkhead over the slide door, at which point the space is naturally only partially filled. The slide door in the covers over the conveyers

The side door in the covers over the conveyers is drawn back by the operator in the tunnel, and the loose coal over if immediately travels on to the convers, which may or may not have been started. If running, then the flow continues; if standing, no different culty articles because the conveyer is only filled at that point, and the sperture becomes blocked and only clears and flow when the belt is started. Then, if no "bridging" or continues the started. Then, if no "bridging" or continues the started of the bold is rapidly and the part of the bold in which is carrying it one which is carrying it one dock and which is carrying it on deck and into the receiving trucks or barges. if, however, any "bridging" is threatened, the operator in the tun-nel ascends to the chamber, and nel ascends to the chamber, and has free access over the aperture to correct any block If "bridging" occurs higher in the hold, then he breaks it by means of a pinch bar through perforations in the chamber sides. When the after end of the cargo has run to its natural angle of repose, the operator now in the hold merely removes the first cover and places it aft of the aperture allowing another portion of cargo to run, he being in a free position to maintain the run and correct any tendency to bridging and to abnormal rushes. If such do occur and incline to block the aperture, he again corrects this and, having run so much more, he removes the next segment of cover, and so on, gradually transferring the aperture from the after end to the fore end of the hold. The wing tanks and central tunnel being sloped, the cargo gravitates to the aperture, and the finals are manipulated by the operator, one man being on each side of the hold. An important fea-ture is the inclined shoot, over which all the cargo passes on to the belt. This shoot is carried on travelers on the guide plate sid and is moved by the operator in the hold forward from stop to stop to correspond with the movement of the aperture thus allowing two men to manipulate a whole cargo at the to manipulate a whole cargo at our rate of 500 tons per hour. It is estimated that in regular working the ateamship "Pallion" will be un loaded in six hours, or allowing for stoppages in moving barges, etc., seven to eight hours, and this too with but one stoker, one engineer rs in the hold, and two adjusting the shoots or booms into the craft The total cost of dis-charging the cargo of the "Pallion" charging the cargo of the "Patrion" will not exceed \$60, including the upkeep of the gear, and it is at-firmed that the cost of discharging a similar cargo at, for instan port of Hamburg, is about \$560, and that in the work no fewer than 110 men are employed for about eleven hours under favorable condi-

> is independent of shore labor, and so may avoid the frequent delays arising from labor troubles. The

arriving from labor troubles. The number of more required is so small, and the time occupied so short, that they receive a fastigut matter to agree with the crew of the vessel that they receive a fast entire to gar, and the discharge of the catro become part of their ordinary duty. A library series of the cost of discharge, under such conditions, would not reach the sum of two coasts pee long, and at this cost the carro is also weighted.

# NOVEL ELECTRICAL APPLIANCES

### BY PERCY COLLINS

The largely increased use of electricity for illuminating distilleries, wine-cellars, etc., has rendered obselse many appliances which were formerly in use-especially those which consume coal-gas when in operation. Hence areas a demand for up-to-date inventions designed to meet the conditions imposed by progress. Few recent patients illustrate more stributely the manner in which the ingenuity of manhitude was near with the artimotics of motors track on the conditions. keeps pace with the exigencies of modern trade than those which are illustrated in the accompanying photo graphs. The patentee and manufacturer of these original electrical appliances is Mr Frederic Hughes original electrical appliances is Mr Frederic Ruighes, of London, England, and it is to this gentleman that the present writer is indebted for permission to describe and illustrate the apparatus in question. In the case of the electric search-light or coliar-tord, Mr Ruighes claims that the appliance stands alone, being the only perfect, clean, oddriess and reliable invention for theoroughly examining brewers' casts,

vais, refrigerators, spirit or oil jars, cic-The main details of the cellar-torch may be sp-The main evenus or the countrier may be appreciated by reference to the accompanying photographs. The reader will see that it consists essentially of a powerful electric glow lamp of peculiar design, supported at the end of a suitably curved rod sign, supported at the end of a suitably curved rod The circumference of this lamp is so small that the appliance can be used effectually through any orifice not less than half an inch in diameter

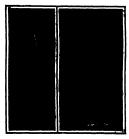

The advantages of this new cellar-torch will be most dily perceived if we compare it with the elder distances which it has superseded. The contact of a gas jet, or a taper flame, with a cold surface (suc as the inner wall of a cask or jar) immediately pr duces a deposit of soot, which may be too slight to attract the notice of the searcher, but will neverattract the notice of the searcher, but will never-heless dissolor and injure to a greater or less ex-tent the fluid with which the vessel is ultimately illied Similarly, when gas is used to "ness" casts, the products of combustion combined with the CO, astready in the cast and the puspent door involved conosal the mustlesses and thus deceive the ex-aminer, who accordingly certifies as clean a vessel which, as a fact, is far from being so With the production of the combination of the combination may partners and the contract of the combination may partners and the contract of the combination may

patent searchlight or cellar-torch the examination may be prolonged indefinitely without in the least affect-ing the actual odor of the vessels interior. As the heat generated by the lamp of this collar-torch is very slight, the appliance may be employed for the examination of vessels containing all kinds of inflammable fluids or gases without the smallest risk of explosion. Each torch may be fitted at will with an oblong or circular mirror, which is screwed to the extremity of the appliance beyond the lamp being passed into the far or cask, a slight pressure against the side or bottom of the vessel causes the mirror to assume a horizontal position, and by this means a view of the under surface of the vessel is readily obtained The advantages of this device will be at once apparent to the practical reader, who will readily perceive that by no other means can the whole wall of a closed vessel be so thoroughly ex-indeed, for the thorough examination of the plored indeed, for the thorough examination of the interiors of bung staves, bushes, boiler tubes, etc., there is no more perfect appliance obtainable than Hugher's cellar-torch fitted with a reflector of suit-

In cont unction with his patent electric torch, Mr In conjunction with his patent electric torch, Mr highes has recently introduced another novelty in the thermo-ore or wax-meiter. This is an ingenious appliance by means of which a perfectly continued supply of meited seating- or bottling-wax may be ob-tained. Like all the most important patents, the apparatus is simple in design and effective in use. When connected by means of the flexible wire with the source of electrical current it is held in the lott hand—the right hand being por-

fectly free for use A stick of wax is fitted into the holder and held in place by means of a serve clip. The left thumb (overcoming a spring) presses the wax downward against the heating receptacle, and by slightly inclining this the melid wax flows through a lip on to the letter, bottle, or other object which is to be seaded Of cooring, as the wax melts, the stick shortens, and to complete the melting of the entire stick a slight mornement of the hand downward on the landle enables the thumb turther to prese the wax multi the whole stick is consumpt—the wax helder travaling in a rew clip. The left thumb (overcoming a

none it becom Whenever it becomes destrable to check the flow of mainted wax, the pressure of the thumb is relaxed, when the apring causes the wax to risis just estileately to the it from the heating late. A flew of the advantages of the thermodiff and be summerated. In the flowt piace, the which is a summerated. appliance may be used in the most confined space, and in any circumstances, with absolute anciety from the fire risk which is so constant a danger where naked gas jets and flexible rubber tubes are employed. Again, the greatest possible economy in the use of wax is obtainable, there being no positive the contract of bility of waste through carelessness, for the reason that melting is automatically stopped the instant that

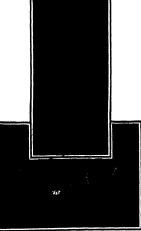

Wax melter in use, scaling bottle cork.

melter.

the appliance leaves the hand No discoloration or smoking of the wax is possible, and the most delicately inted scaling-wax will remain perfectly true to the original shade Finally, the sesting can proceed continuously, and in any position, the appliance needing no proliminary properation, while all splands or cropping of the wax position, the appliance are considered to the control of the scaling let term, postal packets, etc. while articles of value may be nafer left in close proximitive without the slightbe safely left in close proximity without the slight-est risk of their catching fire

The New Agricultural Portilizer The manufacture of fertilizors is one of the most important of chemical industries, but this manufac-

ture together with the exploitation of the nitrate The flexible electric cellur-torch

Colleg-torch heads, showing lamp and mirror (delashed). HOVEL BLECTRICAL APPLIANCES.

beits of Chile and the potash deposits of Stassfurt, is now in a critical stage of development, owing to the increasing production of nitrogeneous fertilisers by the fixation of atmospheric mitrogen, and also to the resuits of recent experiments on the fertilizing effect of extremely minute quantities of totally new agents. The properties of both classes of these new fertilizers are briefly described by René Vallier in Revue de

Chimie pure et appliqueé.

I RITHOGENOUS PERTILIERES OSTAINED FROM TER

ATMOSPHERE

Nitrates Neutral nitrate of lime, containing 13 Misrates Neutral nitrate of lime, containing 13 per cent of nitrogen, has been manufactured at Notodden, Norway since 1905 It is an excellent fertilizer and equal in all respects to Chile nitrate it can be mixed with superphosphate without causing appreciss of nitrogen or retrogradation of ph acid its hygrometric character makes its applica tion somewhat inconvenient, but it possesses, in con-trast with Chile nitrate, the advantage of adding to the soil lime, an indispensable plant food, instead of sods, the accumulation of which may be injurious to

It appears probable that Chile saltpeter will, be it appears processe that Cale sattpeter will, no-fore long, be supplanted by nitrates obtained from at-mospheric nitrogen. The Birkeland Eyds and other processes now in use are commercially practicable in their present form, only where water power is cheap, but these processes are susceptible of great improve ment An efficiency equal to that of most other processes of industrial chemistry would make it co mercially feasible to produce nitrates everywhere At present the nitric acid obtained from the air is neutralived with lime while most of the world's produc on of sulphuric acid is employed in the man of superphosphates. If this nitric acid could be used to convert the tribusic calcium phosphate into the superphosphate an enormous saving could be effected superphosphate an enormous saving could be effected and a fertilizer produced which would contain both soluble phosphoric acid and nitrogen in a form suit-able for assimilation, and would drive every other nitrogenous or phosphated fertilizer out of the market

The difficulty of applying the light cyanamide powder has been overcome by adding a little water, which combines with the quicklime of the crude cyanamide and forms a coarse powder called granulated cyanamide which is much more con-venient in use. A still better form is oil cyanamide, made by mixing the fine powder with 4 per cent of crude petroleum. The proportion of nitrogen in com-mercial cyanamide has been increased by improvemonts in manufacture from 15 per cent to about per cent, that of pure calcium syanamide being about 35 per cent Cyanamide has now fairly entered into agricultural practice The trust which controls the sale of the product in Germany and Italy sold 3,000 tons of cyanamide in the first half of last year

Calcium cyanamide (CN,Ca), treated with water and carbon dioxide yields dicyanamide (CoN,H.) in the form of nearly insoluble colorless crystals, which contain 66 per cent of nitrogen and form the richest nitrogenous fertilizer ever produced. In some cases the cost of production of dicyanamide may be counterbalanced by the economy in transportation Applied to wheat in the quantity of 30 or 40 pounds per it has produced excellent results

Guillin has proved that more than one-fifth of the nitrogen of symamide is converted into ammonia in one week and more than one-third in two weeks, by the action of soil moisture Muentz and Nottin ob-served in two months a production of nitric acid corresponding to 11/12 of the nitrogen of the cyans

mide added to the soli

The poisonous action on plants which was at first attributed to cyanamide fertilizers appears to have no existence or to be due to impurities. The germinating power of wheat treated with pure cyanamide or dicyanamide is not diminished but is sometimes increased Muentz and Nottin h ever, observed a temporary arrest of growth after the application of cyanamide in hot dry weather, and therefore advise the selection of a wet period for its application

IN THE APPLICATION

11 PRITTIPERS CONTAINING MANGATESF
Manganese is widely distributed in nature and
plays an important part in the formation of the
diastases which are the principal agents in vogedisatisses which are the principal agents in vegi-rable synthesis Nagaoka, in Japan applied man-ganese sulphate to rice plantations in quantities equivalent to from 16 to 50 pounds of Mb, Gs pei acre, and obtained increases of crop of from 2 to 37 per cent. The banadical effect persisted to a smallest extent, through the following year Manganese chloride, a waste product of the chlorine industry, exerts a similar action.

In Europe, Voelcker and others have obtained in-In Europe, Vocicer and others have obtained in-creases in the crop of wheat up to 20 per cent from the application of from 25 to 50 pounds of managases sulphate per are Excessive doscs (100 pounds) dim-lnished the crop Similar results were obtained with cade

Grégorie, Hendrick and Corpiaux observed little benefit from the application of manganese to suga beets, but Gasola obtained increments of 46 per cent in roots and 26 per cent in sugar from mange chloride and of 24 per cent in roots and 65 per cent in sugar from manganese sulphate—the chloride diminishing and the sulphate increasing the richness of the fuke

With flux (invols obtained the surprising increase 64 per cent in totally dry weight from manus chloride, and 31 per cent from manganese sulphate concludes from his analyses that the mange inpulsed is assimilated by the plants and that the dif-ference in molecular weight of the chloride and sul-phate determines the degree of influence on the formation of disstances

But the effect cannot be wholly due to the man ganese which is assimilated, for Bortrand found no more manganese in out plants, the growth of which had been increased by manganese, than in the co trol plants to which no manganese had been applied And recent American experiments have proved that pertilizing agents act partly by destroying the toxing left in the soil by the preceding crops. Unstable man gamese saits might be expected to promote the exida tion of these toxins. Manganese exide, traces of which occur in most soils, is entirely inert. The greatest proportion of successes has been obtained with manganese sulphate.

#### UI STIMULANTS AND POISONS

American experimenters have revived the old theory of De Candolle, and proved that infertility may be due to poisonous excretions. It is conceivable that minute doses of powerful poisons might destroy

that minute doses of powerful poisons night destroy these excretions or prevent their formation Cupper Saits The saits of copper have long been employed for the purpose of desiroying fungous para-sites of the grape, and fields of young grain can be freed of certain noxious weeds without injuring the grain plants by spraying with a 5 per cent solution pper sulphate Quite recently Breal has in d the yield of maize by from 27 to 86 per cent by scaking the seed corn in a copper bath and then drying it before planting. The bath was composed of 3 parts by weight of copper sulphate, 30 parts of starch and 1,000 parts of water

Eine Javillier, inferring, from the presence of sine my plants that this metal must perform son function in vegetable physiciasy made an extrasive os of experiments which proved that infinite quantities of zine promote the growth and multiplica tion of mold and yeast fung and some chlorophyl-bearing plants. For example the growth of a certain d was stimulated by cultivation in a medium con mold was stimulated by cultivation to success.

Inthing 1 part of zinc in 50,000 000, the maximum increase was produced by proportion between 1 in 10,000,000 and in 12 5000 and still stronger solutions executed an unfavorable or toxic influence. Micheela d an unfavorable or toxic influence and De Heen find that zinc salts promote the germina

Also: The large proportion of alumina found in the ash of criain exotic plants (more than 50 per cent in the Australian irve Orlies cavelsee) led Yamano to try the effect of aluminous fortilisers on alum, added in the proportion of 1/5 per cent to the water in which young barley plants were growing quickly killed the plants, but proved much less injurious to barley growing in the ground A distinct fertilizing effect, manifested by increase of crop was observed to follow the application of 1/20 per cent and 1/500 per cent solutions of ammonia alum to barley and flax the effect of the ammonia having been carefully eliminated

Magnesia. The presence of magnesia in all plants

and in all soils long ago suggested the employment of magnesia as a fertilizer Tribut's recent study of arose proves that magnesia can act as a ferme Magnesian fertilizers were formerly employed, to some extent and with good results. In recent experiments magnesia has been found to increase the crop of grain potatoes and boets chiefly by promoting the assimilation of nitrogen

asaministon of nitrogen

Brownine Aso finds sodium bromide stimulating la
very aunali doses and poisonous in larger doses to
beans growing in pote One part of bromide to 80
million 5 million and 1 million parts of earth produced increases of crop of 93, 48 and 29 per cent, respectively

lodine and Fluorine Potamium lodide, applied in dilute solution, appears also to act as a stimulant or a poison according to the dose. Aso and Susuki obtained a large increase in crop of rice from about 140 pound of the sait per acre but very little increase from 14 paged while Hollrung diminished the crop of sugar beets by ope-fourth by applying about 4 10

pound per sore. Analogous results were obtained by the same experimenters, with sodium fluoride, applied

to the same crops.

Rare Elements Cerium, like manganese, app act as a ferment Ass finds thorium rather injurious than beneficial to regetation Nakamura has increased the yield of rice, growing in pote, by 70 per cent, by mixing with the soil 1100000 of its weight of lithium carbonate, but a dose 10 times greater produced a crease (55 per cent), caesium carbonate, in the same doses, produced increases of 1314 and 9 per

#### IV BACTERIAL VERTILIZERS

The discovery of the mechanism of nitrification and the fixation of atmospheric nitrogen by the bacteria of root nodules, soon led to attempts to aid the process by the addition of nitrogen-fixing bacteria. In 1895
Nobbe and Hillner patented a process of inoculating peas and beans and the soil in which they grow by seaking the seed with an infusion of a gelatin culture of the bacteria of the root nodules. Bayer offered a pure culture of Ellenbach's bacillus, mixed with potato meal, but Macrker soon concluded, from the contra dictory results obtained, that the preparation had failed to prove its value In 1904 the United States Bureau of Agriculture distributed 12,000 boxes of bacterial cultures, which appear to have produced good results, in the majority of cases

But the effect of these preparations is uncertain, as ne abrupt change of medium may avert the development of the bacteria. The soil naturally swarms with nitrifying bacteria, but their growth may be checked by various causes which will have the same effect the few millions that are added

Stocklass has endeavored to obtain hardier varieties cultivating the bacteria in a large mass of earth. and has obtained remarkable results, but in view of the uncertainty mentioned above, it is prudent to defer judgment until several more years of experi-

THE VALUE AND THE PUTURE OF THE NEW PERTILIPERS The value of the nitrogenous fortilizers obtained by artificial methods has been abundantly and decisively proved, but the same statement cannot be made in regard to the other new fertilizers every one of which has given contradictory results in the hands of differ at experimenters Similar uncertainties, however, attended the earn experiments with other themical mittilizers the value of which is now universally recognized. We have learned how to use nutrient certifizers and we shall learn how to use stimulants. And this knowledge will be productive of incalculable benefit to agriculture

#### Charcot and the Antarctic.

Lest anyone should suppose that Dr Charcot went to the Antarctic largely for the purpose of reaching the pole it may be said at the outset that his chief object was one of scientific research only. He only object was one of scientific research only He only He only resched lattitude 70 degrees, and therefore can hardly compare in achievement with his professessors, and colably with Shakishion and Sectio. What he did was to expiore a region of archipolagoes and vaterways, or which very little is known, and to broaden our knowledge of an ice barrier which extrade westward from the South Sheitand lisheds subroades. Although Dr Charcot returns with now of the larmin of Sheitandies of the companion will increase of Sheitandies when the supportations will increase of Sheitandies of the supportations will

laurais of Shackieton and Scott, his explorations will be of much assistance to foture hatarctic explorers From the meager account of his findings it would seem that any attempt to approach the pole by way of the strate of the Scott Shekland Islands is doomed to failure, and that Commander Fearry sind of the tacking the pole is a direction opposite to that puraued by Shackieton is hopeless. So far the only starting point that holds out any promise at ail is the starting point that holds out any promise at all is the base of Ross's ice barrier, where the volcanoes Erebus and Terror are to be found Here and here only can an expedition whose well made the control of the an expedition winter not more than a few hundred miles from the pole

#### The Current Supple

The current Suppressent, No 1782, contains some very striking illustrations of the Paris flood, which show to what extent the capital of France has suf-fered from the inundation. Mr H F Stimpson contributes an excellent article on efficiency in shop opera-tions, in which he shows how shop efficiency can be reased, as well as some results secured by the methods which he advocates. Mr Claude Grahamsen, while, in an article "Some Emperiences of an Ariator," sketches his own experience, and thus shown many an aspiring aviator what he has to avoid. Another paper on explosives for use in cost mines by Munroe and tillul a presented. The second and coscieding installinesty of the article on the Wright its particles, containing extracts from the court's option and the briefs is published Br F Dablet concludes the symbol of the property of the court of the symbol objects of the sy he pays a tribute to that great man's engineering abil-ity When the Nebel Prize was awarded to Mr. Marconi, he read a paper at Stockhoku, in which he sum-marked the recent development of wireless talegraphy. That paper is published in the current Supprensience.

#### An Injunction Agels

Judge Hand, in an opinion filed in the United States Circuit Court, granted the injunction pendente Me saked for by the Wright Company against Louis Paul-han, the French aviator, alleged to be using in his sahibition flights here a machine which is an infringement of the patents granted to Orville and Wilbur Wright. This decision prohibits Mr Paulhan from Wright. This decision prohibits Mr Paulhan from using his machine in this country pending the trial of the Wrights' suit against him.

After discussing the prior discoveries cited by the

defense, Judge Hand in conclusion cays

erenne, Jugge Hand in conclusion says
"It is, of course, unusual to grant a preliminary injunction before any adjudication and without any
sculisseence However, when the right is not seriously attacked, and when the infringement is clear,

the court should not hesitate to interfere
"From the showing made I cannot doubt that the
complainants first put into any practical form the system of three-rudder control. That there may be other systems is not the point, let the defendant use those if he will Nor is it necessary to conclude that the complainants were the first to fly Upon that I decide nothing whatever, for it is not an issue in the case.

"All I do say is that I cannot find that anyone prior

to their patent had flown with the patented system, and that the changes from the specifications which the defendant had made are no more than equivalents which do not relieve from infringement.

"It is quite clear that for the complainants' protection a writ must go pendonte lite, because the defend ant, being a non resident, who is here transiently, there is no way in which they may insure themselves of the monopoly they have acquired except by prevent ing his use of it at once"

#### A Library in the Sahara.

The French Colonel Gaden, who recently led az ion into the southwestern region of the Sahara, found in the course of his investigation that one of the most powerful princes there, the Sheik Sidis, was the most powerful planess tore, the Snick State, was the founder and possessor of a rather large library, a report of which is published in the latest number of the Revue du Monde Musulman This library is small, indeed, when measured by our ideas of such a founda-tion, for it contains only 683 books and 612 manution, for it contains only 833 books and 612 manu-scripts Still it not only preves that a most urgant need of books has seized the most distant outpost of Mohammedan cultivation, but also provokes most lively interest in consequence of its composition

Approximately the books comprise thirty groups re-lating especially to koranic crudition the dectrine of iating especially to Koranic crudition the doctrine of faith, history, jurisprudence philology, travel and dis-covery, poetry and fiction, married life, magic recipes, interpretation of dreams and astrology. The library, therefore, bears the impress of sheer orthodoxy, which is further manifested by its lack of books from for-bidden provinces, such as philosophy and the natural sciences, but already the existence of printed books, on of which is deemed a rigorous contra diction of the strict tenor of the Koran, proves that relution in the production of books, which b in Stamboul toward the end of the eighteenth century. has to-day acquired citizenship in the whole Islamit world, and that at no remote day also in this circle of world, and that at no remote day also in bits circle or culture and of passionate political aspiration and archivement the printed book will force the written book into a very dim background Islam, long ob-structed by crass ignorance of many foreign things among them books especially which could have exer-cised a most beneficial influence on its daily life, is built discussed by the frequent book in its own longues. which comes galloping from European publishers eve into the precincts of its haughtiest orthodoxy Tp printed book is already an irresistible leaven in Islam

#### Booth of Altred to

Alfred Spear of Passaic, N J., died at his home in his 87th year He was one of the first who over con-ceived the idea of a moring sidewalk. His model in-terested such men as Peter Cooper, Horace Grealey, and several other prominent men The scheme had h to commend it that two Legislatures, the of 1873 and 1874, authorised the use of his sidewalk but the Governor of the State vetoed the bills.

#### Hiveren of the Telephone The Ser

Proces has calculated that an andible sound is produced in a telephone by a current of 6 by 10.2 amperes, and Pellat has calculated that a sound is produced by a difference of potential between the two sta-tions, amounting to only 1-2000 voit. These statements tions, amounting to only 1-most work. These statements give some idea of the great sensitiveness of the most are telephone, but the sensitiveness of the human or, which perceives the invisible villegibles of the telephone displaragm, is no loss rectarification.

#### Correspondence.

## NOW A TROLLEY GAR REVERSED ITS POSITION.

To the Editor of the Scurrytto America On January 80th, 1910, about 13.40 P M, a curious and unique socident happened in regard to limited our No 130, D. and F, at the crossing of Main and ash Streets, Piqua, Ohle. The phenomenon was so remarkable that I have concluded to make this report of it, and if you see fit you may lay it before your

The car was headed south on Main Street, runni The car was neaced soun on sain street, running perhaps ton or twaite miles per hour At the switch in Ash Street, where connection is made with the city line, the rear truck left the main line and followed the Ash Street line, and the car body turned completely end for end, returning almost completely to the main line. Neither truck was at any time of the rails and even the trolley wheel was still in work ing contact with the over-head wire when the car stopped The brake rod connections were all stripped stopped The brake rod connections were all stripped and torn loose, also the wire connections from controllers to motors were severed. No one was seriously injured, and a casual observer coming on the scene, as the writer did, a few minutes after the occurrence would not notice that anything out of the ordinary had transpired

The attached diagram shows five positions assumed by the car in its wonderful evolution. The relative position of the truck with reference to the body and also to the tracks is shown, the end of the normally positioned toward the center of the car body boing indicated by a and b The end of the car headed south before the accident is indicated in each figure

Fig. 1 indicates the status of things when the truck

much experience in the Himalayas and who states to Prof H. C. Parker that the amount to be allowed for refraction on high sow mountains was most uncertain, that therefore the altitude of the great Himalayan peaks, though given in precise figures, was ee in the Himalayas and who stated

Furthermore, I once met a former member of the British Royal Engineers who told me that the triangu fation of the well-known mountain K' recently at tempted by the Duke of the Abruszi, was made by a friend of his, whose allowance for refraction was double what he thought should have been made. With the smaller allowance K\* would be about 4000 feet

the smaller allowance K' would be about 4000 feet higher than it is now regarded. It is therefore obvious that if similar allowance for refraction is made on Huascaria, it may easily hap-pen, especially in a country with a much drier atmo-sphere than India that the nountain is 1,000 reported. So feet higher than has been figured Accordingly while it is perfectly poper for all who desire to do so to accept the figures of the trinaquia tion, regardless of the careful ceitmant of myself and

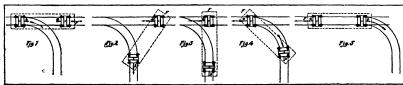

of the Swiss guides and of the evidence of the photo-graphs, no one need feel obliged to accept those figures an Anal

As to Aconcagua being the highest of the Andes. may say that aside from Huascarán there are sever mountains which may prove when carefully measur to be of greater altitude than Aconcagua In this connection it may not be wholly out of pla

to say that while Mrs Fanny Bullock Workman has. according to the newspapers frequently announced h readiness to furnish evidence of the altitudes claimed readiness to lurish evidence of the altitudes claimed by herself, when I wrote to her stating that I should be glad to see the figures of her observations, an in terest shared by some other Alpinists she informed me that they had not been published in any of her The Harriman is a special 4-cylinder motor of 50 horse-power and weighs 300 pounds 1t has copper water jackets and aluminium crank-case. The bore and stroke are 5 inches. The 5-cylinder V type motor her crank-case and cylinders cast of macadamite eviloders are lined with cast fron and the nistons also cylinders are inceeding rade out to an in a pictons also are of a special grade of this metal. The bore and stroke are each 4 inches. The output is 50 horse power at 1,200 revolutions per miaute. The 12-cylinder V-type Buffum motor is constructed similarly to the Easttype summ motor is constructed similarly to the East-on each row of cylinders being cast in one piece with the upper part of the crankcase and afterward being bored and lined with east from This motor is beauti-fully dnished. Its weight complete is but 415 pounds, and an output of 100 horse power is claimed for it at 00 revolutions per minute

Upon entering the large main hall of Mechanics Building the visitor saw upon his right the Bieriot and Antoinette type monoplanes of the Stientific Aeroplane and Airship Company of New York. The former of these machines which is fitted with a 4-cylinder air-cooled 2 cycle motor has lately been experimented with opon ice by Mr Stanley Y Beach and is in a fair way of making a flight in the near future. The Antoinette type monoplane was shown with a huge red 9-foot pro-peller of special design, which has been found to be very efficient design, which has been noting four having two superimposed wheels was also fitted. Opposite these two machines were two Wright type biplanes of Frederick P Schneider. The finished one of these two machines had movable flaps upon the rear edges of the wings instead of the warping arrangement used by the Wrights.

ding onward around the hall, the visitor next saw two new monoplanes—one (the Morock) a small demountable Bleriot type machine having wings laced upon steel tubing and the other (the Burlingame) a

b is about to turn from the main line. Figs. 2, 3, and 4 show intermediate positions, and Fig. 5 the car when E B RAYNER it came to rest

(The mere momentum of the car would not secon I no more momentum or the car would not account for the return of the car to the main line. The fact that the trolley whoel remained on the line suggests that the motorman must have reversed the rear motor, which acted to push the car back in the reversed post tion to the main line.—Ep.]

#### MISS PROK REPLIES TO MRS. WORKHAM To the Editor of the SCIENTIFFIC AMERICAN

Having observed in your issue of February 12th a letter in reference to the altitude of Mount Husscarán and my record from Mrs. Workman, may I state my own position a little more definitely?

After making the ascent of Mount Husscaran, north eak, September 2nd, 1908, of which I brought back absolute proof in the shape of photographs, I gave my reasons for believing the mountain to have an altitude of 24,000 feet although on account of the high wind had been unable to take hypeometric observatio on the summit.

on the summit.

Naturally, I did not expect the scientific world or
anyone cise to regard my estimate as an exact measurement. If anyone did so, I cannot be responsible
It was, of course, quite within the province of any
one to take so great an interest in the matter as to

spend some thousands of dollars in sending engine to Peru to make a triangulation of the mountain, a

to revu to make a triangulation of the mountain, and to publish this as the absolute height of Husacarán.

There is, however, something to be said in regard to the accuracy of such triangulations. Permit me to quote from the recent work of Mr. A. I. Munm (of the English Alpine Club). "Five Months in the

Minutary me.

The results of triangulations do not through agree and even when they precidently coincide, they cannot be accepted as shoulding insupersakable. There is good reason to end on the suppose for the allowatons made for it to be perfectly accurate and higher and more remote the amount, the larger in the higher and more remote the amount, the larger in the suppose of th

# The Acronautic Show at Boston

The first exhibition of aeroplanes, balloops, and aeronautic apparatus exclusively to be held in the United States was held in Mechanics Hall Boston, Mass, from the 16th to the 23rd instant. This first Aeronautic Show, although fairly representative of the different exportmenters, was somewhat of a disappointment in that there were no motor-driven heavier than-air ma that there were no monor-driven nearier than air ma-chines exhibited that have actually flown, while 69 per cent of the power machines were shown without mo-tors. This fact however, did not deter one from get-ting a good idea of the design and construction of the lanes proper

The question of reliable light weight mo sonable price is still a burning one, and a fortune awaits the man who will produce such motors-of and 50 horse-power respectively—to supply them to aviators upon easy terms. Eight different makes of motors were on exhibition, three of these (Curtiss, Cameron, and Harriman) being of the 4-cylinder 4 cycle type, two (Waterman and Duryea) of the 4-cylin syle type, two (Waterman and Duryan) of the 4-sylin der, 3-yche type, and two (Bandon Cordage (wonpan) and Bintum) of the 4-cyte, 8-cylinder and 12-yrlinder y type respectively. An Eibridge sylinder and 12-yrlinder y type respectively An Eibridge sylinder water-cooled 3-yrle motor was also shown on the Wright type blass of F P Bchneldor The 5-bornes-power 4-cylin der Duryan motor which was shown upon the Bletch type monoplant of Stanley Y Beach, is alrecolded by means of thin copper stripe wired to the cylinders of the Charleston motor—a4 was a 8-cylinder of 50 and 45 has considered to the cylinders. horse-power respectively—are also air-cooled with the usual cast flanges. The smaller of these two motors and the Duryea motor both weigh about 200 pounds, or approximately 50 pounds more than the Curtiss 25 30 water-cooled motor with radiator and water. The reason for this apparent superiority of the water-cooled motor as regards weight is found in the fart that the moter as regards weight is found in the fart that the Corties is a specially ensurenced acrossatic motor, whereas the air-cooled motors mentioned are simply automabile motors adapted to accrossative use and not lightened nearly as much as it is possible to lighten them. The same may be said of the Ribridge, which is a marine motor. The Waterman, another light in rine motor built for canoes and dorfes, weight in maker 100 pounds complete with flywheel, which can be Atmonged with and develops about 15 horse-nower

large monoplane with trussed inclined struts running from the bottom of the wide central frame to the ends of the wings A 50-horse-power Harriman motor, di-rect-connected to a large and thick propeller, was placed at the front of this monoplane

A biplane that attracted considerable attention was at of Victor Page. This had a rectangular central that of Victor Page. This had a rectangular central body and extremely thick wings with a deep curvature, A novel revolving cylinder 2-cycle motor (the L. A. W) was pivoted in front, so the propeller mounted upon it could be directed upward or downward

The Hayward and Erickson biplanes were construct ed entirely of bamboo In general outline they re-sembled the Curtiss, as did also the Eisner & Downey and the Reaud machines. The Erickson biplane had a Ruick automobile motor weighing 240 pounds fitted, the weight of the biplane alone being but 220 pounds

weight of the hipiane alone being but 220 pounds.
The finest piece of construction on exhibition was
the Herring machine, built by the Starling Burgess
Company, a well known but building concorn of Marbishead, Mass This machine, in general appearance resembling the Curtiss biplane was mounted upon three round skids no wheels being used. The horithree round skide no wheels being used. The bort-sonial rudder was worked by the valutors feet and the vortical rudder by hand. A long inclined rod was placed on each said of the seat, to which the aviator can cling. Springs were introduced in the gars wires, no turnbuckies taing used. The poles that entry the front and rear rudders were all hollow. A Curtisa motor with a 4 banded propoler of Mr. Interlage design was fitted. The machine complete weighted less than 600 pounds. The propeller is said to give 200 pounds. trust, which, it is claimed, is ample to start the ma-chine on any ground on its skids. The stability device for lateral equilibrium was not exhibited

for lateral equilibrium was not arbibited. There were also soveral glids ro not view, and a large number of models of all kinds, most of which were built by boys. The exhibition as a whole was a very creditable one. It leads one to believe that America. will soon catch up to Europe in the aeronautic industry as it did with the automobile

Balloons were also in evidence Among them was he New England Acro Club's balloon in the very mid dle of the hall, inflated almost to its full capacity This balloon has made 45 ascensions and has traveled 1,251 miles Lee Stevens exhibited the basket of his 30-passenger 160 000 cubic foot balloon. A huge hot-30-passenger 160 000 cubic foot balloon A huge hot-air balloon from which a trapeze performer made five parachute drops at Coney Island last summer is also

# THE COCHIN FOREST RAILWAY

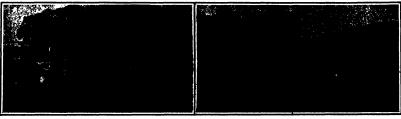

#### BY EDWARD HARRAN

The Cochin Forest Tramway is an interesting little not tramway on the motor gaze in the sent independent State of Cochin in South India It runs alightly to the north of the 10th parallel of latitude and to the cast of the 74th parallel of longitude, and owes its origin to the fact that the forests of Cochin form one of the most valuable assets of the State, their approximate area being 605 square miles, or nearly one-half of its entire extent. Their commercial importance it is stated, was vaught realized as far back as the beginning of last century, but the earlier attempts to work them were of the usual spasmodic and unsystematic nature which characterised original criteria in foresty throughout the Indian peninsals. In the year 18th, over 18th, ov

fact that is land route, provided means of transportion over it were available, would up a far richer forcet area than a proposed river route alone, while, of course, it would be open all the year round. So it came about that the idea of a transway in three so-tiens arose, were recommended to and mancioned by the Durbar The first section was to cover a distance of 8 miles in the valicy, to be followed by a self-acting inclined transway 5,000 feet long. The second section, 4½ miles long, was to be followed by a sittle Apollow of the course of

logs both at the head and foor of the silde preved expensive. To remerly this latter, the occurration of the silde into another self-acting incline was decided upon. To remody the first, Mr Alver Chetty recommended, and the Durber Sammer of Chalakrud, to make the Shorant-Cockin Railway at that station, a consistency, with the sequineceme of the Madras Railway authorities, being made between the railway authorities, being made between the railway and transway there.

To-day the total length of the line as it stands completed at the time of writing is 49% milles divided halo three sections. The first section extends from mile 31, to 21, the second from mile 32, to 17, and the lite from mile 35 to 43%. The first and second sections are connected by a self-sciency wire rope manipolated double way of 15 miles, while the second self-time density connected by another incline a mile in learnth unities in learnth section.

The logging locometive, truck, and cabenee

Stone-and-timber bridge on the line of the Cochin Ferest Railway.

A train of timber cars. Note the density of the ferest growth,

State, there was little or no pretense made of administrating the forests on scientific principles, with the more or loss natural result that while the interior of more or loss natural result that while the interior of the state of the transporting the cut timber! remained practically outside the state of the state

Highness the Maharaja of Coobin to the Parambiblosian and Neillamptiv forests in October, 1993, suggested a revision of this scheme which provided for the areasion of the proposed transvey to Parambiblosian, an additional 13½ miles, the experience gained during the preceding year or two barting shows conclusively that the Parambiblosian River could not be relied upon to carry were year anything like a year's full yield to carry were year anything like a year's full yield

of timber A survey of this extension was made by Mr Haldwell, a specially engaged engineer, in 1804 According to the original scheme, the traction of the timber trucks was to have been by manual labor, but when the length of the proposed line amounted to 31 miles, it was recognised that manual labor would prove both too expensive and too laborions, and in Espémber. 1904, lobemotive engines irraction was fassily decided upon The modifications of the original scheme airrady alimded to mocessitated a full reconsideration of other portions of it, chiefy the proposed combined river and read transport whole it was anticipated would not clear the accumulations of timber Also in practical working it was found that a timber slide, especially in the case of bengthy, and howey long, was unsatisfactory, and the handling of Throughout its whole length the Cochin Forest State Railway is excellently constructed. The gage is 1 meter; the average gradient of the line 1 in 50 and the maximum gradient I in 2.5 which gradient ocurs on the third of the five inclines which have been embodded in the construction.

passes over a groored pulley 6 fast diameter, after which it forms a figure 8 over a looss pulley back again over another 6 foot pulley mounted on the same short as the first and thence to the other line On the vertical short on which these two pulleys are, and on which the rope blads are mounted two hort sented 4 cmm pulleys each 6 foot diameter 3% inches broad with 1% inch fanges 8 teel hand brakes 3/16 host blads and 28 technic backes directed with sh thick and 8 inches broad studded with hard od brake blocks 6 inches long can be applied to see drums by powerful linked levers controlled by these frame by powerful linked levers controlled by hand wheels and erway, to control the speed of the lead descreding the incline. The groomed pulsays round which the rope binds are filled in with leather sections on end grain to give a good grip. The cast iron portion of these wheels is suitably downstalled out to contain the leather packing. The first second and fourth of the five inclined ways are on curvers round which curves the wive ropes are guided by vertical rollers. On the straight portions

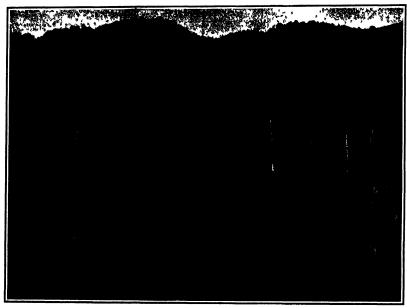

the inclines the cable is supported by horisontal lars placed 30 feet apart Illustrations of one of

sistent examination Frof Moser has yet made. In this cave were found four such layers of clay separ ated by layers of sales. While relies of the new age were found in the first and second layer of ashes in the third and fourth layers were discovered remains of the painters mussel land snalls the bony scales of the swamp-turtle and a mammal fauna such as the otter beaver goat stag and wild bear which manifestly point to the fact that the first cave-dwell manifestir point to the fact that the first exceeded are recorded to the reast vacate districts for their sustance while the later cave-dwellers found a much more generous source of nourtheast along the coast An important fact is the presence in those oldest layer of frequent tools and to the same layers belong the especially interesting art objects engravings on saimal bose described pictorially many of them in the Profusors report. On a polished pitte of sings about the contract of the c

Moser cave and very recently the Professor found a wall preserved human lower javones in the so-called Cave of the Bears' Bandstones marked with grower made by whetling the bone tools on them prove that the cares were also the workshops of the cave-dwell ers. A high degree of development is allowed by the pottery, the vessels formed by a free hand are manifold not only in their form and material but size in the contract of the olor in which are the ears of corn and leaves of paim which ornament the band. This piece aim reminds one of the decoration of Mycensean pottery

## Have Pishes Memory !

Studies as to the mental powers of animals have already been made on several occasions but only recently have inquiries been made as to whether fishes have a memory or not Results have shown traces of a m mory both in coral sooj byt s and other different of the dol Experiments have been made with sev

Part of the main line with empty train on a grase THE COCKIN FOREST BAILWAY

se inclines are here reproduced. The rolling stock of the Cochin Forest Railway consists solely of oper trucks specially designed for carrying limber with swiveled bolsters and chilled cast-fron wheels

#### The Art of the Cove-Bweller.

The Art of the core-Develler.

A very neterority discovery or caves which has brought to light a number of art objects of the oldest inhabitants is reported by Prof. Mose; in a last number of Unachan In a depression which has the appearance of a trought of the valley extending route the Karst (Anstralian) plateau Trisate Nabressian Drian, to the Valait Keuntians are found unmere caves to which leads a gate of rock under the project ing wall of the old? Their interiors are rooms small or spacious, which were first only place of sojourn for the Karst own-dwales who originally nomade inter settled down to habitual residence in them that the contract of the light of of the l

On a second engraved piece of bone a jawbone that was found in the third layer of sahes is pictured with a contour of almost straight lines a wild boar of which the head is almost triangular the tuaks being clearly drawn the eyes and ears being faintly indicated the bristles on its back appearing with per indicated the bristles on its back appearing with per fact distinctions and the curl in list vall being rether indistinct. That the artist of the care sought to re-produce the aspect of nature in which he had often seen and sishn the wild bear is shown by the high gream in which the animal stands and which is repre-sented by strong incisions. On a think hone is restly recognized the head of a not surface with any and desp-recognized the head of a not surface with any and desprecognised the head of a scaturite with aye and dependent most the scales and folds of the skin relationship of the most the scale and the sca

While the layers of ashes contained a generous num ber of finely worked tools of bone and pieces of orna ment, the occurrence of relics of man himself is re-stricted to two streetons with additions from the

eral fishes bit the most siriking results have been obtained with the gray p reh which lives hi fly on a small silvery huck sardine. Some of the work taken and colored red and were then jut into the tank where the perch was with several oth reliver colored sar the perch was with several oils sellice of countries of course it normal one-were at one at tacked and eaten but it was not till hungry fast the victime on recombing the sail to flar in however hap romptly demollah it is mainter a list of any in the specimens in the tank decour it he sardines irrespective of color thus showing not only tra us of a men my but also the lower work of the contribution of the sail of the contribution of the contri sequently sardines colored red and blue were placed in the tank together with the silver on s the came seeme was repeated the blue ones not being atta ked till the others were eaten and hunger compelled in restigation of the new comors. After this introduc-tion the perch ate the mardines of all threetyp a with out any difficulty. Some spines of the sea n. iii (ac tinis) were then fastened to the blue sardines these were at once avoided by the petch who; runtily got out of the way of the new comers. This showed traces of memory as the results of contact with the sea net-tle were clearly shown and recognised.

# THE NEWLY DISCOVERED GOBLIN SHARK OF JAPAN

BY DR L HUSSAKOF

Every now and then the zoological world is startled by the announcement of the discovery in Japane waters of some very rare or very ancient type of animal. So often is this the case that coologists have come to look upon the deep waters of Japan as a sort of naturalists wonder realm- a preserve in which live all manner of interesting animals some of them of an archaic type long extinct in other parts of th The expectation of remarkable discoveries in these waters is so strong that I have heard a distinguished American conferent who is himself well acquainted

Inpunese waters say that he would not be greatly surprised to hear some day that a real Mosasaur or ichthyosaur had been hooked in the depths of Auro Sharo or warm Black Current of Japan

It is in these waters that Japanes fishermen occasionally take on their lines a shark whose grotesqueness has won him among natives the name of Traguzame or goblin shark One of these "goblins" came into the hands of President

David Starr Jordan of Leland Stanford University a quzen years ago and was at once recognized as an interesting archaic type whose close relatives had long since become extinct President Jordan described it under the name of Milsukuring osceloni-the name being given to honor at the same time the late Prof kakkhi Mitsukuri who for a quarter of a century was the leading light of Japanese xoology and Mr Alan Owston, a natural history dealer of Yokohanis, who was instrumental in securing the specimen name, by the way, does not stand at the present day but must be replaced by Reapmorthynchus—a name which had previously been applied to the teeth of the extinct species of this type of shark found in the rocks of the Chalk period, in different parts of the world in accordance with scientific usage therefore, the Japanese shark described by President Jordan

must now be known as #capanorhynchus onstoni

It is now to be recorded that a second species of
gobiln shark has turned up in a most unexpected way It happened thus All of the sharks caught in Japan in the past years and

sent to the various mussums - about twenty in all-were, tooked upon as belonging to the same species, S owstoni No one had ever thought of comparing several specimens, in fact, these sharks are so rare in museums that comparison is generally quite out of the question it was therefore a pleasure for the writer to have of comparing several lections at Columbia University and the American Museum of Natural History and to find among them s new species of the goblin shark This has recently been de scribed in the Bulletin of the American Museum of Natural History as Respon-rhynchus fordant—the вресійс name being

ven in honor of President Jordan, our greatest au thority on the fish of Japan

w to come to the fish himself illustration (Fig. 1) the new shark is certainly grotesque, well deserving his sobriquet 'gobliu' The largest specimen in this country is one in the National oum at Washington measuring over cleven feet, the species probably attains a length of fifteen Fortunately it is not given to frequenting the hathing-beach, but keeps to deeper waters—usually about fifty fathoms. As is generally the case with fish from deer er water, this shark is soft and pliable. Even after bardening in a preservative for several months, it can be relied into a bail. The most remarkable feat ure is the curiously elongated "nose" (shown in Fig. 2) It is this together with its protruding jaw and amail bendy eyes, that gives the shark that univ

appearance. The teeth (Fig 3) are sharp and slender, each like the pointed end of an awl. They constitute a most effective weapon, which must be fingered. with discretion even on the laboratory table the peculiar anatomical characters, suffice it to say that in the total make-up it is so different from all other sharks that President Jordan was at first inclined to classify the genus to which it belongs in a special family by itself

As to the differences between the new species and the one already known, we need say only a few words

The pictures show the differences at a glance even to the layman in matters ichthyological (lower picture) is distinguished by a much less pro-truding jaw, by a very much smaller spiracle (the minute accessory gill pore seen at some distance back of the eye), and by the fact that the eye is situated opposite the middle of the jaw instead of back of it These features are quite sufficient, in the opinion of experts, for separating our goblin as a distinct "kind To the general reader they may perhaps be of inter as examples of the degrees of difference which are un e which are used by specialists to distinguish species of fish

Pipe, Cignrelle, and Cignr.

The question as to which of the three forms of smoking, the pipe the elgarette, or the cigar, introduces the greatest proportion of alcotine into unoker's system has never obtained a combletely de er, although it has received consid discussion from time to time aAt one time it was freely asserted that the tobacca which contained the

ter of fact, carbon monoxide is invariably found in all tobacco smoke, and that circumstance should be suf-ficient to warn all smokers against inhaling it per ould be sufficient to warn all smokers against inhaling it per-sistently Theories as to what happens in the com-bustion of tobacco in the various ways it is smoked next took into account the extent to which condensa-tion products were formed and retained in the to-The most effective condensor, of course, is the pipe, and there can be little doubt that owing to length of the stem a comparatively small proportion these condensati on products reaches the n In the cigar, on the contrary, the

densing process has a ter to travel throughout the cigar, at all events, as the cigar gets shorter the condensed product area gradually reaches the mouth and ally the products are conveyed there by the heat of the burning end it has been said by connoisseurs that no cigar is worth smoking after one-half of it has been consumed which seems to be a practical realization of theoreti-

cal considerations very suitable for application by millionaires Again, a cigar that has been partially smoked and then allowed to go out is decidedly unpleasant when re-lit, owing doubtless to the spread of condensation products to the mouth and. In the or consensation product to the mouth care. In case of the pipe, the burning area is always in the same place, if never comes near the mouth, and therefore the probability is that the condensation products do not reach the mouth in, at any rate, appreciable quantities in the cigarette the condensation products eventually reach the mouth, but there is in this case less chance of condensation products forming since the combustion is unhampered, the tobacco being freely in contact with the air The ques tion of maisture, however, must not be left out in these considerations, for it is obvious that damp tobacco will form condensation products more readily than dry tobacco. It is probable, therefore, that a dry cigarette gives off less poisonous produ than a damp one does, but not everyone smokes from choice a new cigar or an old cigarette It is reason-able to conclude that

the amount of nico-tine reaching the mouth does not necessarily depend on the amount in the tohe but on the form in which it is sm In drawing this conclusion regard must, of course, be had to the quantity of to-bacco smoked, but if the conclusion is correct, the pipe would come first as the least harmful form of tothe cigarette, and lastly the cigar—Lancet.

It has often been remarked that the centers of sciemic and volcanic activity move slowly westward in a recent issue of the Physikalische Zeit-schrift, H Wehner adopts this belief and endeavors to explain ment by reviving the

old hypothesis of a solid nucleus, separated by a thin stratum of liquid soun muceus sources of a time structure or ignored from the earth's crust, and rotating slightly less rapidly than the latter According to Webner's calculations, the nucleus makes a complete revolution, relatively to the surface of the earth, in 862 years. (There is room or a good deal of uncertainty in such calculations,) Webner supposes, further, that the nucleus is studded wenner supposes, intrast, tast the nucleus is stuaded with protuberances which are centers of activity and that these protuberances, coming into comtact with weak parts of the earth's crust, cause earthquakes and rolcanic cruptions. From this theory and the records volcanic cruptions. From this theory and the records of earthquake shocks observed by navigators of the Atlantic Ocean diaring the last sixty years. Webner con-cludes that a group of these dramitable protherences has now arrived under the region between 1 bigs. Na and 1 deg 81 institutes and 87 and 48 deg. W. hongitisels, and that danger is tumbient in these part of the, world.

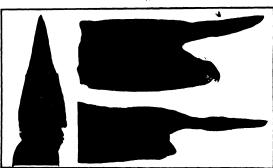

Fig. 2.—Heads of two species of gobils shark The lower one is that of the newly discovered Jordan's gebils shark (Sespanorhyachus jordani). --- Under side of boad of Jordan's goblin shark.

THE NEWLY DISCOVERED GOBLIS SHARK OF JAPAN.

highest amount of nicotine necessarily tended to be the most injurious, no matter in what form it was smoked, but we now know that the form of smoking plays an important part. There was a theory that not in all three cases was the original nicotine in the tobacco conveyed as such to the mouth, sometimes it was destroyed by effective combustion, while at other times pyridine was responsible for toxic effects. According to this theory which was all on the right track the cigarette was least harmful, because the tobacco along the thin paper wrapper was expe eely to the air and as a consequence the tobacco was stell burst and all nicotine was destroyed Against stell burst and all nicotine was destroyed Against this it was hold that in such a case one poince disep-pared only for another one to be elaborated, and arbon monostile was found in marked quantity as a poisonous constituent of cigarette smoke. As a mai-

#### FIREPROOF ABOR.

Pictured in the accompanying ongraving is an arch used more particularly in firsproof work, which is of very simple construction. It consists of but two tile sections, each provided with an air space usually designated as a "vacuum." The usual I-beams be-

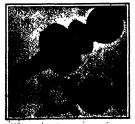

-

tween which the arch is formed are indicated at A and B. Back anch member comprises a top past A, a bottom panel D and a side panel E thus giving the member the general shape of a wedge. At the point of the wedge one of the members is provided with a tompet P, while the other members is provided with a tompet P, while the other members is provided with a tompet P, while the other members with the state of the produces are fitted between the I is amist they are thus retrieved and B To resist this thrust the beam and B To resist this thrust the beam are braced by means of cross rook, as indicated by produces an outward spreading thrust against the team are braced by means of cross rook, as indicated by part of the upper panel of no of the sections howen away to reveal the reinforcing which, in this case, consists of a notting of heavy from or steel wire in bedded within the material. The lower panel is braced by means of brar B dimbedded therein which exicate up into the tongue P. They take the each threat the vaccious of own which we can be a supplied to tween the panels serve to prevent undue travel of heat through the arch in case of fire A building having a large proportion of such arches is therefore to that arch is attent rendered more marry frouppoof than would otherwise be the case. The inventor of this arch is a larged to proportion. The Timestria, or 150 Withers Birest, Rookhyan, Y? Pitcapatria, O. 150 Withers Birest, Rookhyan, Y? # Reliable Powers for Pennsylvania R. R. REMINDER BULLETIN

## A Boon to the Busy Man

The use of the most modern type of speed-making locomotives, coupled up to the best type of equipment and guided by the most vigilant management makes railroad travel secure and prompt.

The time of a busy man is one of his assets. It means either gain or loss to hum.

The certainty of figuring his time m transit to the exact hour relieves his engagement list from entanglement. The telephone may make the engagement, the train will keep it.

The Pennsylvania Special follows up the telephone message. It brings the two ends of the wire together and consummates the meeting between working hours.

The man with business connections in New York and Chicago can lose no time by traveling on the Pennsylvania Special. It runs while the desks are closed.

Pennsylvania Special (18 hours between New York and Chicago) leaves New York 3.55 p. m. Downtown Tube 4:05 p. m. and arrives Chicago 8 55 a. m.

Over five hours for business to 2.45 p. m. when it leaves Chicago for the East and arrives in New York next morning (Breakfast on the train) at 9:45 a. m.

# Are You Getting A Dollar's **Worth of Steam from Every Dollar's Worth of Coal?**

Coal is but a means to an end, and that end is the running of a mill, a locomotive, a steamship, a dynamo. It is most important, because here the first loss so frequently creeps in.

Users of steam coal should purchase their fuel supply so that they are assured beforehand of a definite amount of steam-raising power.

# F BITUMINOUS

a high grade of Bituminous Coal for steam purposes, is all taken from the same basin in Cambria County, Pennsylvania, Its heat constant. units are practically The shipments run uniformand just what PARDEE COAL will do under the boiler is

There's a dollar's worth of steam in every dollar's worth of PARDEE COAL. Ash and sulphur are at the minimum. That is why PARDEE COAL earns a premium for its high steaming qualities from large users.

That is why PARDEE COAL is the most economical. If you use but a dozen tons or many thousands per month, it will pay you to investigate. The services of our mechanical engineer or chemist are at your disposal without charge.

A TRIBUTE TO AMERICAN SHIPBUILDING LTHOUGH the general public has apparently failed to appreciate the significance of the recent winning of a \$22,000,000 order for but eships by an American shipbuilding firm competition with the leading yards of Great Britain, France Germany, and Italy, the importance of this

prante terrinary, and tasy, the importante of this matter is fully apprelated abroad.

The facts are as follows. About one year ago the Argentine government asked for proposals for two first class battleships, and it requested four American firms and all the leading foreign shipbuilders to can irrais and an the dashing for an emploiders to put in bids on the contract. The plans submitted wer not accepted. The Argenilae Commission then pre-pared its own specifications and asked bids from a salected number of these contractors. On the receipt of the second lot of bids it again narrowed the com-petition down to one American from, the Forr River Company two English firms Vickers Sons & Maxim and the Armstrongs and one company each from Ger many, France, and Italy As a result of this last com petition the award was given to the Fore River on designs and price submitted by President Francis T s, formerly Chief Naval Constructor United States navy One of these ships will be built at the Fore River yard and the other by the New

Nork Shipbuilding Company
Judging from such particulars regarding the design
of the vessels as are available, they will be the most powerful fighting ships affoat at the time of their Although in displacement they will not exceed two intest battleships the 'Wyoming and 'Arkan the disposition of their twelve 12 inch guns is such that they will have a considerably more powerful tion of fire on every point of bearing excep m This advantage is secured by placing the two ship turrets in diction or diagonally, an arrangement which permits the four guns in these turrets to he trained dead ahead or dead astern as may be de sired Since the four 12 inch guns in the pair of turrets in the bow and at the stern can be trained axially, this ship will be capable not only of concentrating all twelve guns on either broadside as will be done by our Wyoming class, but also (ight guns dead a and eight dead astern as against a fire of four ahead and four astern for the Wyoming 'The belt is to be 10 inches in thickness and the speed 22 knots Apparently, unless some other features of the ship have been sacrificed this vessel represents the high relopment of offensive power yet attempted in the history of warship construction

the American tender was lower than that of That the American tender was lower than that of such firms as Vickers and Armstrong is explained by the fact that armor plate and the steel for the hull construction can be obtained at a lower price in the l'uitled States than it can abroad, the difference in this regard being so great as to more than offset the high cost of American labor. Whatever be the reason for our success, the fact remains that the place ing of this large contract with an American firm adds greatly to the prestige of our yards and testifies to the high point of excellence to which warship construction has been carried in this country. In this connecpaths of the United States to any proposed m ures for the resuscitation of our merchant marine has reduced the construction of merchant vessels to such a low point that our leading shipbuilding vards are to-day kept alive almost entirely by government orders Nor must it be argued that the securing of for work. Nor must it be argued that the securing of this large warship contract proves that there is no necessity for government assistance in the upbuilding of our merchant morine, for the question of the sales cost of running a merchant ship, which is much

higher in the American than in foreign service, do not enter into the consideration of warship construction Moreover, the competition in the construction of merchant steamers is much keener and the prices are rela-tively lower than for the construction of warships

#### COULD THE EARTH COLLIDE WITH A COMET?

N May 18th next the earth will be plunge into the tail of Halleys comet and th head of that body will be but 15,900,000 miles away it is but natural that a think-ing man should ask is there a possibility that the may encounter a comet and thus come frightful and?

Curiously enough, it was Halley himself who first cointed out the possibility Whiston Newton's successor in the Lucasian chair of mathematics at Cambridge was so slarmed at "a charlot of fire' which flared up in his day, that Halley was prompted to look clos into its movements. His work led to the startling reinto its movements. His work led to the startling re-sult that the counts, when passing through the descend-ing node had approached the earths path within a run idiameter of the earth Naturally, Halley won-overed what would have happened had the earth and the comet been actually so close together in their respective orbits. Assuming the comet a mass to have b parable with that of the earth (an assumption which we now know to have been utterly beyond reas concluded that their mutual gravitation would have caused a change in the position of the earth in its orbit, and consequently in the length of a year. This train of thought led blin to consider what the result of an actual collision would have been, and he concludes that so large a body with so rapid a motion were to strike the earth-a thing by no means impossible shock might reduce this beautiful world to its original

Hence Halley not only dispelled the superstition the terror which once followed in a comet s wake, but also pointed out a possibility which the superstitions Dark Ages had ever dreamed of It seemed to Halley not improbable that the earth had at some remote period been struck by a comet which, coming upon it period been struck by a comet waten, coming upon a chilquely had changed the position of the axis of rotation, the north pole baving originally, he thought, heen at a point not far from Hudson's Bay The more recent investigations of Kelvin and Sir George Darwin

ompletely upset any such theory Since Halley's time the chance of a collision be tween the earth and a comet has engaged the attention of many astronomical mathematicians Laplace, for example, painted the possibility of a collision with the arth so vividly that he startled his day and generation He drew a picture of a comet whose mass was such that tidal wave some 13 000 or 14,000 feet high inundated the world, with the result that only the higher peaks of the Himalayas and the Alps protruded Lalande created a panic by a similar consideration of the subject in a paper which was intended for presentation before the Academy of Sciences, but which was not read the Andermy of sciences, our which was not read Such was the popular excitement, that he felt himself constrained to allay the public fears as well as he could in a scothing article published in the Clazette de France The masses assumed by both Laplare and La lande are so preposterous that their theories are no longer seriously considered by any same astronomer

Since the day of Laplace and Lalande there have been several comet "scares" Biela's comet crossed the earth's orbit on October 29th 1832 When that fact was announced, Europe was in a ferment The orbit of the earth was confused with the earth itself was the popular excitement, that Arago took is upon himself to compute the possibilities of a collision He pointed out that the earth did not reach the exact aport where the comet had intersected the earth's orbit spot where the comet had intersected the earth's orbit until a month later, on November 30th, on which date the comet was 50,000 900 miles away Incidentally he pointed out that a collision was always happily remote. Ht thought that the chances of a meeting were about one to 28100,000 Babinet, on the other hand, thought that a collision was likely to take place hand, thought that a collision was likely to take place once in about 16 600 000 years. More recently the en-tir, problem has been considered by Prof W H Picker ing of Hararat By a collision he understands, first, that any part of the earth strikes any part of the cornet sheed, second, that any part of the earth strikes the most condensed point in the head (the core) and distinguished from the larger nucleus. What the average size of a visible comet's head may be, we have means of knowing Young estimates that for a telescopic comet it averages from 40 000 to 100,000 miles in diameter. The head of the great comet of 1811 was 1 200 000 miles, that of Holme's comet in 1892, 700,000 miles, and that of naked-eye comets generally over 100 000 mile

In the last half of the last century 121 con cluding returns penetrated the sphere of the earth's orbit From this Prof Pickering infers that we should expect to be struck by the core of a visible comet once in about 40 000 000 years, and by some portion of the head once in 4 000 000 years. Since comets' orbits are

regions of the sphere, the collisions would occur rather more frequently than this, but hardly as often as ones in 2,000,000 years, and since it has been estimated thai animal life has existed upon the earth for about 100, 000,000 years, a considerable number of collisions, perhaps as many as fifty, must have taken place during that interval, in Prof Pickerings opinion, evidently

without producing any very sorious results

The old notions of the tidal effects of comets were based upon an erroneous conception of cometary masses. It seems astonishing that a man of Laplace's wonderful mathematical powers should not have con that a body like a comet, which can sweep through the entire solar system without deranging @ one of its members, must have a mass so t that it cannot appreciably affect the waters of the As it is, comets are more likely to be captured by planets (witness the comet families of Juniter and Saturn) than to derange a member of the solar syste or to produce tidal effects.

plunging of the earth in the tail of Hall comet naturally causes many to wonder what will be the effect upon the inhabitants of the earth Similar passages occurred in 1819 and 1861 but no one was the wiser until long after. Some astronomers claimed to have noticed auroral glares and meteoric displays at the time, but whether these were really associated with the comet or not cannot definitely be stated At all events, it may be safely held that on May 18th next none of us will be aware of the fact that we are literally breathing the tail of Halley's comet From this it may well be inferred that the wild tales of the possible effects of poisonous gases, tales for which the new papers are very largely responsible, are uterly wither foundation It is true that a comet's tail is compose of poisonous and asphyxiating hydrocarbon vapors as or poissones and asphyxiating hydroarbon vapors and of tyanogen, but it is also frue that the actual amount of toxic vapor is so small that when the earth is brunked by the tail of Halley's comet, the composition of the atmosphero will not be so affected that a classist could detect it Flammarion has drawn a vivid picture in his 'La Fin du Monde' of the possible effe passing through a tail highly charged with vapors. He has shown us terrified humanity gasping for breath in its death struggle with carbon monoxide gas, killed off with merciful swiftness by cyanogen and dancing joyously to an angesthetic death, produced by the co sion of the atmosphere into nitrous oxide or destist's 'laughing gas' No one of any common sense should he alarmed by these nightmares particularly when it is considered that so diaphanously thin is a comet's tail, that stars can be seen through it without dimis

#### PATRIT .COMPLEXITIES IN GREAT BRITAIN. N the course of a judgment in an important se

case before the House of Lords, the supre tribunal of Great Britain, the Lord Chancel lor made very pointed references to the lor made very pointed references to the complexity with which patent specifications are sometimes encumbered. During the past few years there has been an increasing tendency to render such pecifications as intricate and as voluminous as sible, thereby obscuring the vital issue Only a weeks previously the Chancellor complained in an other action of the manner in which claim and narra tive had been so intimately interwoven that considerable difficulty was experienced in unraveling the real factors in the issue Such a tendency, the Lord Chan-cellor pointed out, defeated its own object, for where patent specifications and claims were so framed as to puzzle a student, business men were afraid to take out a license for its working, for fear their interpreta tion of the patent might be found to be erroneous, be found guilty of infringement, and be mulcted in heavy damages The particular case in which the Leve Chancellor was constrained to make these comments was in connection with improvements in the casting and trimming of stereotype plates. The court contended that the specification of the original pates was extremely voluminous and complicated, amount-ing almost to the bulk of a treatise, in which there was infinite redundancy and repetitions, and constant references to illustrations which were somewhat difreferences to illustrations which were somewhat car-fecult to follow it was a document which needed a prolonged and penetrating study in order that may one who wished to work out problems in this partice lar field of industry might know how to avoid all pos-

ible risk of infringement.
In the course of his remarks the Lord Chancellor pointed out that inventors who drew up such compli-rated claims must run the risk of the whole patent s declared void by the court on the ple biguity The framing of specifications in this man-ner he declared to be an abuse of the law, and he gave the warning that it would be checked, if the ocgave the warning that it would be checked, if the or-casion arose, by the simple process of declaring the patent invalid. These timely remarks have been reactly appreciated by British commercial and mann-facturing establishments, and there is no doubt that advantage will be taken to draw up specifications in a more concise and itself manner.

#### Engineering.

The Chaeste modal, founded by that celebrated as glacer, Octave Chanuts, and awarded by the Western Boolsty of Engineers for the best paper precented during the year, has been gives to Ford Taibot; University of Illinois, for his paper outlied "Tests of Cast Iron and Relatorved Concrete Cuivert Pipe," which embodied results of a research extending over a number

The Interests Commerce Commission points with pardonable price to the saving of life and limb which has resulted from the operation of the safety applinace law In 1890 one out of very 340 men employed in car coupling was killed, and one in 13 was injured, whereas in 1800, one out of 89 was killed, and one out of 49 was injured—an increase in the factor of metry against cleach of 1814, and against injury of

In addition to the three dreadought battleships which are being built for the Brazillan navy, the pregramme of construction includes ten destroyers of the stanks segoing type being built by Messra Yang Siz ser in commission and the seventh recently exceeded her speed of 27 knots during trials on the Cyde, carrying a load of 100 Loss. These ressels are 340 fest long and they are propelled by twin reciproculting engines of 5,000 herespower

Mon 3. Arnold has been appointed subway negineer for the city of Chicago, and it is probable that should nise miles of subway will be put under construction fortwith. The city has ansike inter funds for this purpose from its accumulation from the street rulivary company's directions, and the street-are companies are bound to excitate the contribute of the contribute of

There is much significance in the recent capture by the Germans of seweral big contraris in this country. The Rhenish-Westphalian works have contracted to be bedd three more 1,0000-horse power turbines for Nigarar Palla power plants, which will make fifteen in all with a total horse-power of 1,0000 Other (1,0000 Other (1,0

These is much talk in the air about the construction of a 30,000-ton battlenship for the littled States may and its cause is to be found in the advent of the new and very powerfail i-finely gain, which recently underwant uncessful tests at Sandy Hook. If the it successful tests at Sandy Hook. If the it successful tests at Sandy Hook. If the it successful tests are the "Wyoming," an increase its remain the same as in the "Wyoming," an increase in displacement becomes necessary Indeed, it is questionable whether even a 30,000-ton ship could mount twelve i-finely gain and give them adequated

Only these who have witnessed the great contestion on the present subway can understand the suprementation to the content of the suprementation afforded by the determination of New York cities were witnessed to the Public Bervice of the Public Bervice of the Ways at a cost of \$100,000,000. The routes include an entirely new north and south subway from the Broat to the Battery by way of Lexington Avenue and Broadway, and a subway in Brooklyn connecting the lines over the Williamsburg Bridge with the new Fourth Avanue route in Brooklyn, the latter to have elevated extensions to Fort Hamilton and Coney Island

The Faderal authorities have approved of plane for the opening of the Delaware filter to a navigable depth of 13 feet as far as the city of Trenton, and it is believed that the development of deep-water navigation farther inland will be only a question of time. In Natroe stupendous work of the shoracter has been done Manchester spent \$80,085,000 on the 35-mile canal, Delaberg in German, 160 miles from the month of the Rhine, and Cologne, 150 miles from the month of the Rhine, and Cologne, 150 miles from the control of the in free communication by water with the seaboard.

REC. Googra Gibbs, Chief Engineer of Riccire Tration of the Pennayivania Tumin and Terminal Rail road, in a report made at the last session of the International Railvey Congress gives some comparative faerace of economy of the West Jersey and Seashors Railway and the Long Island Railroid on lines that lever formerly operated by statu. During 1908 the Long Island Railroid operated the storic line at 17.30 cents per sair mile as against a cost of 17.50 cents for stans per sair mile as against a cost of 17.50 cents for stans once ways 8.45 downth for shorter in against 13.50 cents for steam mineage. The relatively unknownthe results or steam mineage. The relatively unknownthe results for the control of the standard of the term service therefore wite couldy; whereas on the Swat Perey Road the the Long Island Railroid and the telem service therefore wite couldy; whereas on the Swat Perey Road the of the electric, and most find service was express and the standard of the service was express with few store and therefore of an exceptionally soc-

#### ELECTRICITY.

The first Edison medal of the American Institute of Electrical Engineers was awarded to Prof. Billu Thomson for his achievements in electricity, on the occasion of the anniversary dinner of the Institute This medal was founded by friends of Mr. Edison, and is intended to commemorate his work

A remarkably ions wireless transmission was reently recorded by the steamship "Tennessee," five days out from Honolulu, which succeeded in catching a nessage from Table Bluff on the coast of California. The message was a weather report, which was after ward verified by the Navy Department The distance of transmission was 4,550 miles

A recent test of wireless telephony was made to show its value for transmitting music. Several selections were sung in a transmitter at Park Avenue and Fortich Street, New York, and were listened to by a group of newspaper son at the Motropolitan Tower. At times the singing was very but frequently it was impossible to heer enything but a contract bir of sound.

A portable transformer drying apparatus has been devised to dry out transformers that have become moist during shipment or storage. The apparatus consists of a furance adapted to hum wood or charcost A current of air heated by the furance is forced through the transformer by means of a blower driven by a small motor. The air, before runching the blown, is filtered through several thicknesses of

The talephones used on the assumable "Instantal require interesting The induction coil condensor, and bell of the instrument are inclosed in a small white ename box, and the switch hook which profess from one afte is provided with superial retaining delete to prevent the receiver from being knock between the provided with superial retaining delete to prevent the receiver from being knock between the receiver from being knock and and the receiver the second of the ship. The reveiver is allowed to rick to not be box, otherwise the lever would like and nake a false connection when the ship was pitching one realizer.

A recent number of the Electrical World describes a very interesting electrical installation on an illustration of a result of a gas-producer in a realisation supplying a 38-horse-power two-yrident para engine to which a 148-liowatt 155-wit direct-current generator is belied. The online also runs a generator is belied. The online also runs a first product of the second products of the se

A new type of long-distance telephone was recently retested aucocardity over a circuit extending from New York'to Chleage by way of Pittsburg, and return The lawation of Dr. Tardisu of Arles France consists in taking the pitth of the measure two o taves and a third by means of a combination of drains. At this light pitch the waves are sharp and abort, and rust turnmitted over a greeter distance than is possible to the pitth of the reserved of the control of the contr

At a revent meeting of the Institute of Electrical Registeers in London a differential electric thormon eter was described by Prof J. A. Plenning. The ther momenter consists of two large flass tubes, nealed air tight at the top and bottom and connected by a tube of fine hore to which it is thread of relored water confine hore to which it is thread of relored water conresistance is to be measured are placed in the tubes, and one of them is connected with a source of high frequency current while the other is connected with a source of direct current. By introducing resistance into the circuits, the heat may be regulated until it at he same in bott tubes, as will be indicated by the table and the control of the con-

A report on the trackiese troller gratems near Vienna has recently been made by the United States Consul General there situated. The current collector used con sists of a small frame supported on the growed wheele which run on the positive and angative wires. The wheel is prevented from jumping the wires by a weight of personal properties of the weight of personal properties. The properties of the propert

A five-mile test of the Edison Beach storage battery our was made here last wook over the 32th Street horse-cut recits. The car carried a number of engineers, who were to judge of its availability for streetcht service in New York. If their decision is favorable Effects of the cars will be put is to service.

#### SCIENCE.

Dr. E. E. Barnard of Veylon Observatory secured photographs of Count & 1990 on January 21st, 34th, and Pebruary 1st, 3rd, 4th, and 8th Cloudy weather prevented the tating of any other photographs. Dr. Barnard informs us that one of the interesting features of the comet was an extension from the head about one-quarter of the features of the country o

The mechanical inhoratory of the Polyrechile Institute of Worrowier, Mana, his undertaken a study of the relative thermal conductivity of rolled copper and of copper deposited by eiter tropies and not rolled The conductivity of the rolled copper was found to acceed that of the electropic copper by 30 per cent. This is an interesting instance of the change in the Annical treatment metals which is produced by mechanical treatment.

Obali and its, in the liquid state, are miscible in all proportions, but solid evolati dissolve unity about compounds Cable and Cable. Cobalt and antimory also mix in all proportions in the liquid state folial cobalt and antimory also mix in all proportions in the liquid state folial cobalt can alway 12% per cent of antimory, with which it forms the compounds Cable and Cable. Cobalt and leafter no definite solid compound and, even in the liquid state each dissolves only a small quantity of the other The same law governs the alloys of cobalt with bismuth and thaillium. Cobalt and site, raced fagather, deposit alloys in whith the definite compound CaZe, has been found Cobalt and well as in the liquid Cobalt and silicon mix in all proportions in the solid as well as in the liquid Cobalt and silicon mix in all proportions in the solid as well as in the liquid Cobalt and silicon mix in all proportions in the solid as well as in the liquid Cobalt and silicon mix in all proportions (Cable Cobalt Cobalt Cobalt Solid Cobalt Cobalt

ropean sportamen are beginning to fear that game will be made scarce by the multiplication of acre planes, balloons, and other aerial vessels it is well known that where many kites are habitually flown they have the effect of driving the game to other districts The effect of a kite however, is very small in compari-son with that of an aeroplane or a dirigible balloon A German landowner, strolling over his estate saw two black storks which had been standing, with a two black storks which had been standing, with a number of ducks, on the bank of a pond, suddenly take to flight, without apparent reason. The next instant the ducks quacking loadly, took wing and were soon out of sight Looking around for the cause birds' affright the proprietor saw a dirigible balls which the birds had probably perceived before it be-came visible to him. He learned afterward that deer browsing in the fields, had been frightened by the sight of the airship or by the noise ma pellers and had fied to the forest. All animals are terrified by airships. Partridges quall, and other game birds crouch and hide while domestic fewis after ud warning notes the instant they perculae the trous bird of prey. The Swellsh aeronaut Von Hoff ken, while sailing at a moderate clevation observed that elks, foxes haves and other wild animals fied at his approach and that the dogs ran howling into the houses. While the Zeppelin III was going from his approach and that the dogs ran howling into houses White the Zeppelin III was going for Disseldorf to Essen the atronauts on board noted to horses and cattle galloped frantically over the fi-on catching sight of the airship

One of the scientific developments of recent years has been the formation of international organizations for the ronatderation of important subjects. International control international organizations for the ronatderation of important subjects. International control international contr

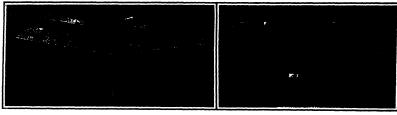

# TWO REMARKABLE SHOWS

#### NOVELTIES IN MOTOR BOATS AND AEROPLANES

The shift annual motor load show to be leid in Multion Square Garden opened on Firmary 19th and loads do not week. The show this year was larger than the shift of the shift of the shift of the shift of the various species and size exhibited. These waited from 10 feet to 40 in highly and in motive power from 1 in too house power. Alton there some fifty loads of various types were visibilited expressing a total tile of E. 2000. The largest visibility of anyon firm was that of the Electric Launch Company of Bayonne

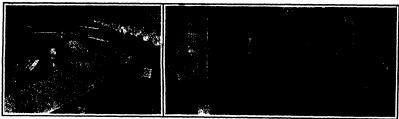

The sixth annual motor boat show to be held in Madison Square darks a negacid on Pistranty 19th and shaddown Square darks a negacid on Pistranty 19th and shaddown Square darks in season of 100 miles on one charge, this company showed a 42 foot making any part to make fitted with a 49-horse-source period of 100 miles on one charge, this company showed a 42 foot making any part to make fitted with a 49-horse-source species and 42 except the state of 100 miles on one charge, this company showed a 42 foot making any part to make fitted with a 49-horse-source part of 100 miles on one charge, the fitted with a 49-horse-source part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company of 100 miles on one charge, the company showed a 42 foot making any part of 100 miles on one charge, the company of 10

with a 60-horse power 4-cylinder Standard motor, and capable of a speed of 15 miles per hour This boat has a large open cockylt fore and att for fair weather. and a sarge open coccupit fore and art for fair weather, and a space loss cabin amidships. The engine is placed forward in a separate compartment and the controlling levers and steering wheel are placed side by side. Other firms exhibited crubers comparable in size to the best just mentioned and fitted with all the conveniences nosided on this type of craft. (Continued on page 200) (Continued on page 209)

# RAPID PROGRESS OF THE NEW YORK STATE BARGE CANAL

A RECORD OF RECENT ACHIEVEMENT

The large amount of work done on the New York State Barge Canal during the past year augurs well, not only for the completion of this great work within the contract time but for its being done within the estimate of total cost of \$10,000,000 Almost as much construction work was completed during the aggregate of the work under contract is \$14,188,229. It is satisfactory to know that this has been as omplished at a saxing of \$25.72.08 over the estimate of 1903 for the same work. Construction work to the value of more than \$16,000,000 has been done nearly one-half of it during the year 1909, fifteen out of the

I hamshed from the paris of the New York Ship building Company Camden N J She is shown selection in a gale of write against a heavy Atlantic visitanting it again of write against a heavy Atlantic high research and the selection of the select huge vossel as she rides over the long Atmusto convention will do her full share of pitching and rolling as she climbs and descends each majestic sea. Several cable down the slope of a sea whose crest is sufficiently high to bide all but the funnels and masts

conditions are no mere creations of the artist s Trasse conditions are no mere creations of the artists a fancy for we have recently seen a series of pictures taken on our fact when it was steaming northward in a heavy gale on the Pacific in which only the tops of the funnels and the fighting masts of some of the ves reis are visible the ships lying deep in the trough of

But although the Utah in spite of her full load displacement of over 25 000 tons will be to some extent the sport of the elements her great weight and slee will make her a far steadler gun platform than is afforded by the 18 00-ton Connection. slee will make her a far steedler gun pisterru than is afforded by the 1600-ten Connection or the 12000 ten Taisine and herein lies one of the most important advantages of the big over the medium size warship. The Utah which is a stater ship to the Florida now nearing completion at the New York anayy and is 5214, feet long 38 feet 145 inches wide and on a normal displacement of 3125 tons her draft is 38 feet. is salie, post long as force the places when him one of the places when him one of the places are not such as a mermal displacement. It should be explained she will have a full supply of anomanition and two thrieds of full supply of stores and result the place and the place of 20 ft house of 20 ft house of 20 ft house of 20 ft house of the place of 20 ft house of 20 ft

Like the North Dakota and Tolsaware the Ulbal earlies des Histohn iques to the main battery. They are mounted in pairs in balascoot turrest the skepoul tolon of which is shown very clearly in our comprehage of the skip. The foremost pair of game has an element of the skip. The foremost pair of game has an element of shoot at point plant has a command of about 10 feet. The smooth pair has a command of about 40 feet. The game of three number 2 have a command of about 30 game of three number 2 have a command of about 40 feet. second pair has a command of about 40 feet. The groun of turnet number 2 have a command of about 15 feet and these in number 4 and 5 of about 15 feet and these in number 4 and 5 of about 15 feet and these in number 4 and 5 of about 15 feet and 16 feet about 15 feet and 16 feet and

water, and of the guns is exceptionally well worked out in these vessels, being in this respect an improve most even on the 'North Dakola' herself one of the best protocted adaps ever bein! In the first place with a view to ilmiting the destructive effects of a torpedo a view to similing the described the effects of a torpedo blow particular attention has been paid to the question of cellular and compartmental subdivision. Even in the event of most serious underwater injury such as might be done by a footing mine the ship is able to concentrate on any compariment or set of compari-ments such a great capacity of pumps that she would be able by the aid of these alone greatly to mitigate the effects of such a blow The armor plan of the Utah is probably the most

The armor plan of the Utan is probably the most complete and effective yet put upon any ship. The main belt over \$ feet wide has an average thickness amidable of 11 in hes. Above this is a second belt \$ feet wide of an average thickness of \$ inches. The lower waterline belt is continuous from stem to stern lower waterine best is continuous from seen to stern and the upper best extends from the wake of the for ward to the wake of the aftermost turret. The turrets of the 12 inch guns have from 13 to 8 inches of protection. The 5 inch secondary battery amidships is protion The 5 inch secondary bettery amidalities is pro-tored by 4%, londess of armor and a similar thickness protects the cassmates of the six gens at the bow and after. Detween such pair of 5 inch guess is a splinter bulkhoed of 5 inch armor and best of such hattery is a longitudinal wall of 3 inch armor with closes in each 5 inch gun. To reach the base of the amobients ks any shell would have to pass through 9% in the sof armor— shell would have to pass through 9% in the sof armor—

as super's profe tion

It will be noted that the ship is provided with two
of the new lattice work fir-control masts with which
all our latest ships have been equipped. The handling
of the beats is done by two beat crance pin ed abreast of each other one on either side of the after amoke stack. In this ship as in all our dream ughts the officers are berthed on the main dick forward below recastle dock the crew accommodation being aft This places the officers near the bridge and convenient The ked of the Utah was laid March 1 to 190) so

that considerably less than a year has claps I be tween the laying of the keel and the launch in I se than a year from the present time if all goes well this fine ship will have her tright a speed in warship this has saip will have nor trains a speed in warming onstruction which is greatly to the credit of the New York Shipbuilding (ompany Particular interest will attach to the trials of this vessel for the reason that abe will be the first of American batticalips to be pro pelled by 4 screw Parsons turbines

According to Electrical Engineering a definite proposal has been put forward for the construction of a tunnel between Dennark and Sweden starting at Copenhagen and connecting up with Malone (connection would be made on the way with the small islands of Amager and Sahtholm and the electric trains which it is proposed to work through the tunnel would was on the surface on these islands in order to reduce the underground (porary as much as possible. If the absent is curried out it is estimated that the trag could be made in 1% hours.

# OSTRICH FARMING AS AN **INDUSTRY**

Boes estrich farming pay? The question is asked by almost everyone who visits an ostrich farm. The control of t answer is that when an acre of alfaifa will furnish a for four birds with food enough to maintain ions for four birds with food enough to mannam them throughout the year when an oatrick will yield annually about two pounds of feathers with an aver age value of \$20 a pound and from thirty six to ninety eggs which may be used for incubation or may fur-nish food at the rate of meanly four pounds to the eggs

num roos at the ratt of marry four potunes to the eag if the owner does not wish to increase his troop estricto farming does pay and pays well. There is nothing very lovable about an estrich a there usually is about other domestic animals. But however lacking in personal charm it may be the big bird is a money producer A head of cattle eats sixty bird is a monty producer. A need or cattle east sixty five pounds of allafa in a day an outrich it on pounds. This head of cattle at five years old is worth \$10 and an outrich at that age is wonth \$2°0. There is nothing to the cattle but ment. At ten months the outrich will produce \$10 worth of feathers and therafter from \$25 to \$10° worth of feathers and therafter from \$25 to \$10° worth of feathers annually for a long acted of years. However, we catch he manufact at the period of years | I hough an ostrich is matured at the age of five and is reproducing its average life is about that of a human being. The bird does not be gin to decline until it is fifty years old. Many how ever produce fine ; lumage at the age of a venty five

There is as much difference a the breed of estriches as there is in any other animal. Some of the (all rais and Arisons male birds are rated at as high as \$7 000 each but ordinarily the value averages about \$400 for a creveroid lird and about \$100 for a chick Some of the cocks weigh as much as [00 pounds and stand over ten feet high

It has of late years been found that a great deal money can be made in ostrich farming Especially so where alfalfa or lucern can be raised on irrigated lands In the Sait River Valley in Arizona there are about 2 0 00t acres of rich land soon to be made richer and more productive through immense irriga-tion works on which the United States is spending \$6,000,000 Such a climate is an ideal one for outrich farming as the farms in that locality have proven by their successful operations. While the birds theirs best in a warm dry climate they can be grown in any of the southern States and Territories of this country in a moist climate however they would have to be protected from cold and rain

only a little more than two decades ago since the first outri her were brought into the United States with the serious purpose of attempting their culture here Before that time the only birds seen in this country had been adjuncts to circuses To-day as cleates of those in zoos there are some four thousand birds on the American continent. Probably half of this number are the progeny of a single pair owned to Arlana in 1891

The female os cock beginning to lay fertile eggs when she is about three and a half years old. The next is nothing more or less than a bole scratched in the ground which is done by the male bird At first the hen may not take to the nest but may lay her first eggs on the ground whereupon the male will roll them into the nest Generally after the male has put three or four eggs into the nest the female will take to it. She will then lay an egg every other day until about sixteen then isy an egg every other day until about sixteen eggs have appeared in the next An entrich egg is neatly eight inches long and about six inches in di ameter it makes a good omslet and is arcellient when scrambled. One egg will make as much omelet as three dozen hens eggs! A full-grown bird has been known to produce over three hundred pounds of egg food in a year

An annual increase of about fifty per cent of a flock

is secured mainly through the use of incubate though on every farm a few paddocks are maintain ca h for the sole occupancy of a pair of birds. Three times a year the hen begins to lay. She does most of times a year the hen begins to lay. She does most of ber setting during the daytime the made bird attend-ing to that part of the household duttes at night. He will usually go on the next about five celock in the evening and remain there until eight oclock next morning. It is thought that the celor of the same has something to do with developing these instincts. The made heline black for nor analyse same with the something to do with developing these instincts. The main being black is not so easily seen at night and the fensale being drah or nearly the color of sand annot be readily observed on the nact in daytime. The male usually begins to sit three or four days he-fore the hen stops laying. If the weather is cold dur-ing the laying period the main will often be found ov-ring the eggs at a thrawful during the night to prevent coming chilled The birds are als them from becoming critical into the same was very watchful in the warmest season to prevent the eggs from becoming superheated by the sun. The birds do this by resting on their ankle joints and spreading their wings umbrells wise over the nest. As is usually the case with all eggs in a dry climate the shell of an estrich egg becomes dry and hard. It is therefore very difficult for the chick to break through. When the time arrives for the liberation of the young they

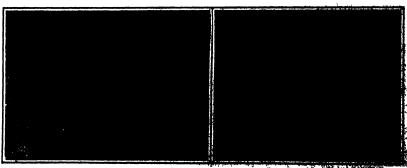

are heard to chirp and to move he the shell, This phreat bird seems to understand the climition, and will often create the shells with he headshoot, some-times taking the young by the head and polling it out the shell. Sometimes there or five days despite be-tween the hatching of the first and the heat egg Thy-ing this time one of the parent interes sixten to the next while the other takes care of the chicks. However on while the other takes care of the chicks Rowwess on a well required out the form the farmor assists the birds in lataching by creating the eggs with a small belower and putting the unhalteded eggs its on at low-

they first come out of the shells yet their hodist are as large as those of full-grown hear. They are as fussy and as soft as a day-old chicken but far more

fung and as soft as a day-old obliven but her more stupid. For the first week of their existence nothing but gravel is given the young ostrobes. Then they are turned into manil poss in the alritals lots where they are to set affaith for the rest of their lives. Plooting it the general term by which the harvest-ing of feathers is known. The term might issed one to believe that the feathers are pulled out. This is not the once however for that would injure the bird. The plumes are snipped off with shears close to the feath. The quills that are left soon die and drop out such The quilts that are left soon its and drop out fare which me whaters before to sprout There are treatly after long white plumes on each wing of the cook bird The reat of the plumes in black on the male and of a grayisk color on the female. Gathering the batthers is no easy task. This work has to be done with great care for a lick from one of the powerful legs of the bird is enough to disable a mas for life or even kill him outright.

At the plucking time the birds are driven into insignificant power of the state of the control of the powerful below the product of the powerful below the product of the powerful below the control of the powerful below the powerful bel

## THE HEAVENS IN MARCH

S the year advances, there a temporary break in the of comctary phenom ona which make the first half of 1410 so not worthy fine an object at the end of Lemany, came almost to test among the stars early in Pobrumy moving sime

straight away from the earth and rapidly losing bright so regain away room on carri and rapany iosing bright nose. By this time it is unobscrable, bolind the sun and some distance north of the cellptic. In another month or so it should be seen in the morning sky, but

only with telescopic sid.

The determination of its orbit has apparently prosented unusual difficulties. In order to calculate a comet's orbit, we must first have accurate observations of the position. Such observations are usually made by measuring with the telescope the distance and direct tion of the comet (or equivalent quantities) from some star whose place in the sky is known from pretions observations taking care to note the time at which these measures were made. In the present case the comet was at first

tistick only in daylight, when no suitable 'com parison stars' could be seen its position in the sky had therefore to bo found by means of the readings of the graduated circles attached to the tele mon, and these are far inferior in accuracy to measures of the former kind

it is not therefore sur prising that the prelimi from these rough observathemselves. When the comet reappears in the morning sky, and can be accurately observed, the comparison of the results with the few accurate observations made in Janu ary and February will set

tle the question Halley's comet is also out of sight for the pres ent-behind the sun nearly so and about 175 million miles away may still be observed telo deally low in the west in the early evening for a few days carly in the month, but it cannot be seen in the morning sky until April is well beguff, when it will reappear much marer us and prob ably far brighter than when it vanished in the twilight

We must therefore for the time being turn our attention mainly stars, and among them we will find much to occupy us while we walt for the

comet to reappear. Let us begin right overhead with the constellation Gemini its two principal stars Cas-tor and Pollux, idustify it at once, for nowhere in our skies are two equally bright stars as near neighbors The roughly parallel lines of stars which run south west from these and terminate in the stars  $\gamma$  and  $\eta$ 

are also easy to identify if once learned
Castor itself is a fine object with even a small telescope, showing double with a power of fifty diameters.
The two components, one about twice as bright as the other revolve about one another with a period of per-haps 400 years. The faint star which lies about twelve times as far from them as they are from one another is moving with them among the other stars, and is probably also in vity slow revolution about them but, if so must take more than ten thousand years to complete in single circuit. The star 3 is also a fine double. Clother but the manual is 2 is also a fine double. complete a single circuit The siar 8 is also a fine double Close by to the canward in Cancer, with no bright stars but one interesting cluster, visible clearly to the naked eye, and resolved into its separate stars by a field glass. This spot of light known as Praceeps (the Beobive), is marked on the map Auriga, which lies in the Milky Way, northwest of

the senith, is one of the finest constilations in the sky The figure of the charloteer kneeling in his charlot forms our initial letter. The most northerly

bright star of the constellation,  $\delta$ , is in his head,  $\beta$  is in his right arm, and the brilliant yellow star (aprila (a) marks the Gost which he is supposed to hold in his left arm, while the three smaller stars just below it are called the kids—an armful indeed. Farther south # is in his right knee, and , in of foot, uncomfortably near the tip of one of the Bulls horns (# Tauri)

Capella is, next to Sirius, the brightest star in the part of the skies which we can see-secording to the data of the Nautical Almanac Arcturus and Vega are however very nearly its equal in brightness, and the three stars differ so widely in color that different observers, whose eyes were unequally sensitive to light of different colors, might easily disagree as to their relative rank Well down in the west are Orion and his neighbors, Canis Major on the left and Taurus on rough the latter Mars passes th the right Mars passes through the latter consisting tion during the month, and fairly rivals Aldebaran in color and brightness. Perseus and Andromeda are in the northwest—the latter partly set—and Cassiopela farther to the left

Farther to the left.

Due south we see Procyon, with the few faint attendants which are supposed to resemble the Little
Dog, high up near the meridian, and part of the great
constellation Argo low on the horizon Farthor east,

right of the pole, Urus Minor, inclease within its aweep; and Copheus, low in the north, complete our

Mercury is morning star gli through March, but, being south of the sun, is not well observable in these latitudes. He may perhaps be seen early in the month, but only with difficulty, as he rises but three-quarters of an hour before the sun.

Venus is likewise a morning star, and, unlike Mor

cury, is very comen

She reaches her greatest brightness on the 18th.
At this time she appears, with a magnifying power of
fitty diameters, just as the creacent moon some five days old does to the naked eye, except that her surface is free from perceptible markings, and uniformly white. She rises about 4 A M and is the principal white, she rises about 4 A m and is the principal ornament of the morning sky Indeed, there is a difficulty about seeing her in broad daylight—if the sky is really clear—except that of knowing where to look for her On the morning of the 18th the cresm will be a good guide, as Venus will lie about five or six degrees nearer the sun, and about two degrees above the line joining them Mars is still an evening star, but is steadily losing

brightness. His distance from us incr

to 170 million miles during the month, and he moves eastward among the stars through Te stars through Taurus, keeping well shead of the sun, so that he remains in sight till after 11 P M

Jupiter is in opposition on the 31st, and is visible all night long. He is a splendid object to the naked eye, and a fascinat ing one in even the small est telescope. His four large satellites can be seen without difficulty, unless indeed some of them should be behind or in front of the planet. In the latter case their shad ows can be seen, as black dots on Juniter's surface with more powerful in-struments, and afford one of the most interesting of celestial spectacles as they transit across his disk The elliptical form of the

planet due to his rapid ro-tation, and the dark belts which cross his disk, parallel to his equator, can also be seen with a small instrument The four other satellites, discovered in recent years, are observable only with a few of the largest tele-

ropes. Saturn is an evening star, setting about 8 P M in the middle of the month Uranus is in Sa gittarius, rising about 3 30 A. M. at the same date Neptune is well observable in Gemini, his position on the 15th being R. A. 7 h 11 m 35 s., Dec

M. A. 7 h 11 m 35 s., Dec 21 deg. 44 min north, and his apparent motion very slow To identify him, how-over, one needs either a detailed star map or a tele-scope large enough to show his disk, that is, six inches

scope large enough to show any unes, unessent or so in apportune or so on the 9th Saturn on the 18th, Mercury on the 9th Saturn on the 18th, Mars on the 18th, Neptune on the 19th, and Jupiter early on the mornonly the last conjunction being at all

#### BULLET'S FLIGHT THE

# SOME NEWLY DISCOVERED ERRORS IN TARGET SHOOTING lines and screens enabled the author to follow the course of each bullet, and the acreens were spaced at distances along the range to match the typeriment in hand A distance of three feet spart was sufficient for

in the face of many excuses, it is a recognized fact that the bullet from a rifle seldom strikes the target where the marksman would like to bave it strike The constant endeavor for years, in all countries, has

been to perfect its errors at the target. Unmoney have been ded in these dorts. According to the author of the book which ites before us, an author who speaks with a conviction gained from years of pa tion the innum able causes of in accurate rife ting, many of which have been known for a long time, may be divided into two great clauses

frui those inhe-

Ø. A STATE OF THE STA

Machine rest target shooting to detect errors in rifle and bullet

those which are external to it. His experimenting and hence his discussion deals exclusively with the errors adherent to the rifle and oxitaited with the errors adherent to the rife and ammunition, and does not consider any of those be-longing to the second class, such as all currents, per-sonal elements of the shooter, bumidity of the sir, or any error in siming the rife. Years of careful ma-thies-rost shooting and the experience of thoughtful rifemen point clearly to the fact that, whom all the elements of the second class are excluded, the rife customerits or the second class are excluded, the rife and its ammunition produce a regular and ever-pres-ent error at the target which has not yet been over-come. To determine the nature of that error is the

rent in the rifle and its ammunition, and secondly,

come to teterature the action of the determinant author's primary purpose.

The cause of this ever spreading of shots he has operimentally disclosed, with the result that the rifleman knows better than he ever did hefore, the defects of rifls and bullets. The book teaches us how to eliminate the errors of the rifls and its ammunition, and w which elements of the cause for such errors cannot be overcome by human skill, thus allo to proceed intelligently rather than under old meth

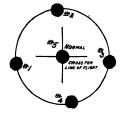

sethed and apparatus to bring out these hither to undiscovered errors are fully sot forth, illustrated, and explained. The system of investigation adopted was based on the principle of exclusion, that is, the when cased on the principle of exclusion, that is, the personal element, movement of the air, mirage, and faulty aiming were eliminated. Covering as it does the work of years, the book is commendably exhaustive

ring 1901 a suitable machine rest, differing ma During 1901 a suitable machine rest, canoring ma-terially from anything before produced, was made as bere illustrated (Fig 1) It was built of concrete, and was permanently rigid Upon it a bronch v three feet long was securely boiled. The barrel of the rifle, stripped of its normal action and wooden stock, was mounted in aluminium riggs, one for the muscle and one at breech, and, thus surrounded, was held in its normal position in the bronse V, which was accurately machined. A concentric action, as shown by illustra tion (Fig. 2), took the place of the normal rifle action completing this part of the outfit The line of fire remained the same from day to day and from year

Between the rifle's musile and target, paper screens

were placed, through which the bullet passed in its flight. A perpendicular line through the perpendicular line through the center of each screen, by the aid of telescope and cross hairs, was hrought into exact line of the V rest, which was also the line of fire of the rife barrel which lay upon it. This arrangement of

testing some of the curves which the bullet made, but in many experiments it was found necessary to place the screens from six to three inches apart to register the bullet's motion Day by day facts were accumu-lated, and at the

end of several years the au could so place these screens that any desired infor mation respect ing the bullet's motions could be expeditiously ob-tained, one irregularity after another being eliminated to that end

As is often case in all scien preconcuived ideas of the bul let's action proved to be more or less incorrect. and

the one to which it seemed all continuous must be made to bend, was found to be absolutely incorret. This idea, that the builted during its passage through the rife must and did fly in a straight line with the box, and the afterness. the rine must and did ny in a straight line with he bor, and that afterward it changed its direction to fly away from the mark, held the author back from the real fact for years. Streens placed at one two, or three fort from the mustle showed indisputably that an unbalanced bullet left the line of fire, or line of the bore, immediately upon its exit therefrom, and the cause of this was a very astounding discovery to make

It is easily understood that the center of gravity of an unbalanced bullet is not in its center of form, and therefore not in center of the rifle bore. Due to the twist in all modern rifles, this unbalanced bullet rotates during its passage to the muxie and carries its center of gravity in a spiral around the straight line forming the center of the bore, and also carries line forming the center of the bore, and also carries the event of grawthy around the center of form of the bullet itself in mechanics and especially in bulling the control of the bullet itself in mechanics and especially in bulling the control of the control of the control of gravity tavols. Hence the unbalanced bullet (all bullets being more or leading method to the control of the control of

When the projectile is liberated at the muzzle, no longer forced to make a spiral flight, it immedia takes up a straight flight, which it must do according to the fixed laws of inertia. This straight line, however is a continuation of the flight which the bullet was making as it left the muzzle not the line of bors, but a tangent to the spiral which the projectile described in the bore as represented though grossly ex aggerated, by the spiral as and its tangent a or ee in

Fig 3 exaggerates and makes clear how the center of gravity of an unbalanced bulkt moves in a spiral form within the bore, but how when liberated at form within the bort, but now with interact at the muzic, it takes a straight flight, as represented by the tangent at the right extrainty of the spiral in the direction of a No possible power at the muzic could make it take the direction of bore as represented by d.d., without districterating the built. Thus the bul let, instead of flying straight in the rife bore as every one supposed, and making some change in its direction afterward, in reality flies in a spiral during its pas-

y files in a spiral during its pas-sage to the muzzle, and does not change its direction at the muzzle, because there is nothing there so to change it. This is the longsearched for cause of error at the

target The presence of this error, called the "X error" by the author, was clearly demonstrated in thor, was clearly demonstrated in screen shooting by R A Leopold of Norristown, Pa a number of years ago, and the apparent change of direction in the flight of a bullet at the muzzi, was known in an indefinite manner to various riflemen Their attempts to overcome it, and the theory upon which these attempts we (Continued on page 210.)

#### TOOL-HOLDING DEVICE FOR WOOD TURNING

BY CHAUNCES IN MIRRAR

those who use a wood lathe find frequent occasion to make special tools for difficult or unusual work, and when the tool is so shaped that the cutting edge and with the fool is so shaped that the cutting edge is at right angles to the shank, great annoyance is gaperienced in holding the tool to the work, and keeping it from turning in the hand Recently I had

TOOL-HOLDING DEVICE FOR WOOD TURNING

a piece of work similar to that shown in the drawing and after many expedients had failed to give complete entinfaction I developed the device illustrated ratisfaction I developed in device mustrated it is prade of heavy sheet storl (the heaviest I could work cash) and provided with two setserows, as shown, to allow it to be moved along the chised as desired, and for the insertion of new chisels As flustrated, the flat portion lies on the tool rest, and this absolute. lutely prevents the turning of the tool. By its use I was able to reach with ease the most inaccessible

## ELECTRIC INCURATORS AND RECORDED

The advantages of an electrically heated incubator over those making use of kerosane lamps and the like are so great, that as rapidly as cheap reliable power a rvite becomes extended throughout the country, the hatching of eggs by electricity blds fair to displace all

other methods.

An electric incubator can be built at home by anybody who can make a wooden box and connect up
ordinary incandessent lamps. Such a machine has
not only the merit of being low in first cost, but of
having nothing about it to wear out, and of being capable of giving perfect results with very little atten tion on the part of the operator

tion on the part of the operator. The photographs show the first incubator built by The photographs show the first incubator built by the photograph of the photographs of the photograp

The boxes should be made of well-seasoned lumb bout 'y inch thick. Old soap boxes furnish goo Old soap boxes furnish good

about is inch thick material for the nurnoso For a fifty-egg machine the inner box needs to be it inches wide, 17 inches long, and inches deep, all inside meas urements This box is to be left without any top or bottom ( reept a statted botton which is to be put in half way down

thus dividing the hox into an upper and a lower compartment of equal depth. On top of the slats a double thickness of woolen blanket should be tacked, to support the eggs, as shown in Fig 1

Eight chetric lamps are required for the heating Eight Circitic lumps are required for the heating units These are best mounted in percelain recep-tacles as shown, four lamps in each compartment near its top. For 110-volt circuits uses ordinary 16-can dic-power earbon filament lamps made for 230 volts, and connect them as shown in the diagram, where *REG* means regulator, or thermostat and *RB* are snap switches to be placed on the outside, as shown in one

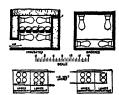

It is hardly worth while to make a thormones, as unitable for the purpose can be bengath from a dealer in electrical supplies for about serenty-recursit, but its not a difficult job for anybody who takes pleasure in defing such work. Fig. 2 shows a relative for the other means training the work of the property of the a thermostat at ose can be bought come next. The strips should be about 1/32 inch thick, 8 inches long, 1 inch wide at the large end end raice, a incass long, I inch winds at the large end and 3/8 inch at the narrow end They may be fast cool together with fifteen or twenty small rivets, or by soldering them all around the edges. The two metals thus joined tend to curl and uncur! with changes in temperature, by reason of their different rates of expansion. The large end should be clamped to a block, B, as shown, and a contact screw should be to a block, B, as abown, and a contact screw should be provided at C, with a sitt wire, D, attached to serve as a screwdriver for adjustment from the outside it is highly important that the up of 30s crew C and the spot on the size (or brase) strip be protected by pierce of pistum soldered on, or the electric are which appears between them will soon destroy than the thermostant be purchased as advised, it much account to the contract of the service of the contract of the mounted in such a position that the adjusting screw on he results the presentative services.

can be reached by a screwdriver or wire passing in from the outside through small holes in the bores. The inner and outer boxes are to be joined at ligh-loruning a doorway or tunnel three inches high-forming a doorway through which chicks may enter the brooding compartment under the egg chamber The inner and outer boxes are to be joined near the top by three or four half inch tubes for ventilation

as shown at V, Fig 2

The top of the egg chamber is best covered over with a pane of glass, on top of which is laid a small pillow or several thicknesses of folded blanket.

Next in importance to the thermostat comes the noice of a thermometer and its proper location in

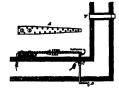

R 1.—COMBTRUCTIONAL DETAILS AND WIRING PLAGRAM OF THE INCURATOR AND RECORDER.

the egg chamber, where the bulb should occupy a trai position rather than one near a corner it is not necessary to buy an expensive instrument in order to get accuracy, an ordinary tencent thermometer can be made to serve the purpose very well provided that its scale be properly corrected or 'calibrated' This may be easily accomplished by taking advantage of the fact that the internal temperature of a normal, seathly person is just a trifle over 98 deg. Tie a thread around the tube at the place marked 98 deg on the scale, and remove the tube from the scale, to which it is usually attached by two bits of wire. Place

eight issues in see, the apparatus as described is capable of maintaining a temperature of 164 dag, fat the egg chamber when the room temperature is due 40 dag. If used in a warmer room, one pair of the lamps in the lower compartment may be turned of ans of the snap switch a pair of \$80-volt 16-candle-power cart

MARKE & MIRE

Buch pair of \$80-roit 15-candispower carbon haspa; connected in series as shown, will, when used on a 15-roit circuit, burn with a dull red give accordy reights in daylight, and with a power consumption of 5% in daylight, and with a power consumption of 5% the temperature is 85 deg, commune about 14 water, making a total for 25 days of about 2 bilowatt butter, which, where the rate is 10 cents, costs 80 cents. This cost tooks high at first sight, but it is materially lower than that of a herosmo-burning machine if one stops to consider he saving in literate on first investment,

Pig S.—METROD OF APPLYING THE THERMOSTAY.

the saving in oil, the absence of depreciation and pair bills, and the saving in labor of attendance.
In the practical operation of the incubator, the following points should be borne in mind

The eggs need to be turned partly over every day A ood way to do this is to take out the row of five eggs at the left hand, end, roll the remaining ones toward the left, and replace the five at the right-hand end This progressive morament zerves also to seen up the different times of hatching that might result from

different times of narrang that many result has some eggs remaining in warmer spot than others increasing ventilation is required as incubation progresses Practically no air is needed the first two veeks, and all ventilating tubes and the door to the lower compariment may be kept closed with comaiderable economy in power During the third week, and especially when the hatch is due, plenty of air must be allowed to filter up through the eggs, as shown by the arrows in Fig 1

No moisture is required during the first week

Thereafter it is best to keep a small pan of water in the lower compartment and a small glassful in the ogg chamber These serve to prevent excessive evaporation of the eggs by too dry air

The newly hatched chicks should not be taken out or fed until they are 24 hours old After this they may be kept in the lower compartment for a time, provided all four lamps be kept burning. As soon as convenient, however, they should be transferred to an convenient, however, they should be transferred to an electric brooder, two forms of which will now be de-

The first and simpler form, suitable for use only in a well warmed room, is shown in one of the photo-graphs. It consists of a small wooden table carrying arapha. It consists of a small wooden table carrying on its under side four lamps, and surrounded by a fringe made by slitting a piece of old blanket. For use on the ground or where the floor is not warm, bottom heat must be provided as shown in Fig. 1. Forty tom heat must be provided as shown in Fig. 1. The foregoing bill does not include the shaded lamp and fixtures shown on the outside of the incubator in Figs. 1 and 2 An ordinary 4-candle-power lamp so venience, but not in any way essential

#### COMPRESENT DOOR HOLDER.

A convenient door holder may be made from a

a convenient coor holder may be made from a barrel hoop, as shown in the accompanying illustra-tions, by cutting a place about eight inches long and inserting a rubber-head tack (such as used in the plumbing trade) at each end, on the under side, as shown in Fig 3 Two such tacks are also placed on shown in Fig. 3. Two such tacks are also placed on upper face, speed apart sufficiently to allow the bottom of the door to fit between them. The archied shape of the hope will give sufficient irritation between the door and foor to hold the door in any desired position. If robber-head tacks are not available the ends may be covered with some soft material such as carrier and tacked thereto. In place of tacks, a notich may be cut in the barrel hoop equal to the thickness of the door as above, in 1864 of the Ulinarization.

door, as shown in Fig. 4 of the illustration. The

center of a barrel stave may be used instead of a hoop by cutting it to about the same width as the hoop

## BORING MOLES IN GLASS.

ersally conceded to be exceedingly diffi cult to work when cold, yet its fragile nature often calt to work when cold, yet its fragile nature often calls for means of repair it it is also desirable some-times to drill large holes in giase plate, or through a glass column, which is not an easy thing to do with any facilities hitherto developed for such work. It is well known that turpestine applied to a small drill will enable one to drill through a piece of glass

drill will enable one to drill through a piece of giase by parasisate application and frequent grindings of the drill. This hele will often taper from a large diameter at the top to a smaller one at the bottom, and busides it is quite impossible to drill two boles of the anne size with the same drill. Instrument, work of certain classes would be made better also if it were possible to an phreads in the gians at which the see other parts are composed. In the opinion of the possible to tap threads in the glass or which the loss or other parts are composed. In the opinion of the writer the best fluid to be applied to the glass so that the tool will take hold is that of the formula given below. It has been developed after many experiments with different mixtures, and will be found to be au

with different mixtures and will be found to be un-perfor in anything heaviors in hours. With a bestard the new with it a piece of plate giass may be put into a crise and filed like wood; any other out of the may is used, but where there is much giass to remove, the compare the file to bester.

For identifier small places, a brass tube of the disa-tion of the plate winded in better than a drill. The land, globally his ensists smooth jet the eith that is to come in particular to what is better, dismodel drill. The land, globally his ensists under damped with curtover-gian province or what is better, dismodel drill. The plates may help in piece of wood having a plate decided of the company of the company of the company of the plates may be in piece of wood having a plate decided of the company of the company of the company of the decided of the company of the com

made in the side of the tube by filing into it with a round file, and it may be turned either by a drill press or by one of the small, geared, hand drall-atocks used for small drills. With a small brush dipped into the solution as herein given wipe the hole so that a little of the mixture will run down inside the tube, and onto the glass where the hole is being made, and the tube will be found to enter the glass with sur-

If it is desired to have the edge of the hole sharp where the tube comes through, coment a small piece of

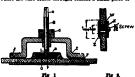

Fig 1 Fig. 1 -- APPARATUS FOR BORISO LARGE HOLES IN GLAM. Fig S -METHOD OF REPAIRING CRACKED PLATE GLAM.

giass to the under side of the plate being bored, and when the tube is through, continue the boring until it has entered the lower plate slightly Glass cut with the diamond will often break unevenly, and fail to fit a window sush, circles cut out for the disks of instru-ments of the clock class, circles for static electric ma chines, glass covers for galvanometers, ammeters, and many other instruments are often thrown away, when a touch with a file wet with this solution would save them It is especially recommended to glaziers to re move the sharp edges of the glass cut with the dia-mond, which often cut the hands. For boring large move the snarp edges of the gauss cut with mond, which often cut the hands. For hori holes in plate glass the Jig shown in the section Fig. 1, is very handy, in fact almost essential if correct re-sults are required. It can be

easily modified to hold the cutter for boring circular work, such as glass columns or con cave surfaces, where circum-stances require such variation The frame is an iron casting having feet J, and is bored out to receive a steel bushing C, which may be hardened receive the shank B of the cutreceive the shank  $\mathcal{B}$  of the utter bar The top of the cutter bar or shaft is squared at A so that a bit stock may hold it, or it may be held by the chuck of a drill press. The bottom has a flange and a pilot L, which fits in the hole of a small ry wheel G of the kind used by toolmakers on univer-sal grinding machines for lapping out small holes.

e lead bushing in the wh

The lead bushing in the wheel should be cut out on the side that is to do the boring, and the should be cut to do the boring, and the cut is the side of the wheel may now be elemented to the cutter shaft by beating it, and also the wheel sightly, so as to moil some gun abeliac, which has been sprinked on the top side of the whole. After it is cold mix up a stiff partie of liquid gits and emery of about the same grade as the side of the whole. The city is still partie of liquid gits and emery of about the same grade as the side of the whole. of In drying it will shrink slightly and the paste be applied again, and until the surface is flush wheel with the side of the wheel.

with the side of the wasel.

The feet J of the frame have thin rubber F (known in the stores as "rubber dam") comented to their under sides with bisycle time cennent, so that when placed on the giasa the jig will not slip around, but can be easily held in any desired location

The place where the hole is to be made having been

The place where the hole is to be made having been scerationed, ring of puty D B stack to the glass to form a cup, and after the wheel shaft is inserted in the bushing, the apparatus is placed with the face of the wheel over the spot to be bored, with the face of the wheel over the spot to be bored, with the face I restling on the glass. Before bourdining operations a place of double-thick window glass I'll incommend with French copil warrah to the under side of the plate to

The formula for the fluid to be applied to the tools

the letter of the shalt into the putty cop' to cover

When the wheel is turned it will immediately en the glass, boring a vory smooth and true hole if a drill press is used, the speed should be slow to avoid throwing the find out of the cup or heating the wheel, the last being especially avoided, as all of the constitu-ents of the find are very volatile, and it will evaporate quickly if much heat is present

When the hole is nearly through moderate the pres-

went too note in nearly tarough monorate the pres-sure, but keep on drilling until the wheel has entered the plate H slightly A slight tap with a hammer will now knock the window glass off, and the wheel and shaft may be removed through the hole. Do not at tempt to remove it through the top unless the hole is very clean, or you will p. Il the wheel off the arbor

Fig 2 shows how a cracked plate-glass window may be repaired. At the ends of each crack and where they intersect a hole is bored to receive a bolt. The they intersect a noie is bored to receive a noi! The mut Z of the boil is made thin, and a rubber washer, made of engine packing is held against the glass by a washer and a rew The dimensions given are thous-used some time ago in repairing a store window. The heads of the screws were located inside the store, so as to make it impossible to remove them from the out side. The window is still doing service

## A WAGON JACK.

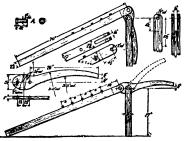

## NY L G. BATLET

For oiling wagon whoels, or taking them off, some kind of lifting arrangement is resorted to For simplicity of construction and effectiveness the jack here with described is unique. The whole, including the pegs or pins A, is made of oak, the best tough white

pegs or pins 4, is made of oak, the locat tough white oak being recommended. The beam is made from 3 by 4 inch timber, planed down to the dimensions given. An eye or slot is cut out at the wide end 1 1/10 in hes wide by 4½ inches deep This end is rounded off to a radius of 2 inches.
Five pegs, 1 inch diameter by 2 inches in longth, are
driven into the upepr side. The holes are 1 inch deep

and should allow the pegs to have a driving fit

The upright is 27 faches high to the center of the

A WARRY JACK

fuicrum, made from 3- by 1-inch stuff. The end is rounded off to a radius of  $1\frac{1}{2}$  inches, and a slotted hole is cut in, as indicated in the detail view

The lover is cut from 1 inch board, 6 inches wide by about 33 or 34 in hos in length It should be laid out accurately to the dimensions given in the larger scale accurately to the dimensions given in the larker is all view. When correctly made and the slot in the upright cut likewise the two holes for the pegs 4 will be in a vertical line, when the lever is pressed down, as shown in the upper general view. The pegs A should have a loose fit, and be furnished with small m pegs or nails, to keep them in place, w parts are assembled

parts are assembled.

To operate the jack the lever is raised as shown in dotted lines in the lower general sketch and the beam slipped in place under the sate of the wagon, which should rest between one of the small pegs in which should rest between one of the small pegs in the upper face Boaring, on the lover it is pressed down into its lowest position, as shown in the upper sketch, raising the wagon wheel from the ground and securing it in that position indefinitely, without the least chance of its slipping back

Swelling ground cannot be held by timber, means must be provided for relieving the pressure of the ground from time to time. It will cause little trouble if spaces are left between the lagging, through which pressure may be eased at intervals by removing so of the material Expedients such as packing with straw are valuable only until the swelling becomes sufficient to pack tightly the cushioning substance. When this becomes packed solidly it transmits stance. When this becomes the pressure to the timbers

## TWO DESIGNATIONS.

(Continued from page 196.) to W. H. Mullins Company exhib heretofore, several of its small steel is, but the construction novelty of the ras a hull built of phosphor-brons show was a null built or phosphor-breuss plates riveted together and attached to the ribe by means of U-shaped clamps passing over the latter and riveted to the bull over the latter and riveted to the hull.

These boats were constructed by the
Davit & De Groot Company, a firm
which has had a great deal of experience
building riveted stochhull liteboats for
the United States government. The phoephor-bromes hull has a great advantage
over the steel hull on account of its nonover the seem and in addition to this the new construction does away with rivets through the ribs. In a 36-foot tivets through the ribs. In a 36-foot of sequence exhibited by the same cencera, sequence exhibited the same cencera, there was installed a new type of hydracities of the second of the with a mixture of oil and giveering, wery slight movement of the transmitting pistons at the steering wheel being sufficient to actuate the rudder positively. The mixture used is non freezing, so that cold weather does not affect it. This ring gear appears to be a decided im provement over the usual form, since it is

ioexing
Probably the most popular craft exhibited were the open speed beats, which vary in price from \$1,000 to \$3,000 or \$4,000
Twenty five miles per hour was the highest speed guaranteed by any of the makers of these boats exhibited, and the materiary of them and not make more than the property of them and the materiary of them and the material of them does not make them. the makers of these boats exhibited, and the majority of them do not make more the majority of them do not make more than 18 or 30 miles an hour For the man of small means who is content to travel slowly, there were boats (open launches) varying in price from \$104 to \$1,000 Some of these launches were fit ted with automobile tops. The cruisers were larger and more comfortably fitted out than ever before. The price of these empared with their size and usefulness. An average speed of 10 or 12 miles an hour is all that is aimed at 12 miles an hour is all that is aimed at with this type of boat. In many in-stances electric lights run from an igni-tion dynamo were fitted, while comfort-able bunks, a small galley, etc., were the

The exhibit of engines this year was a large one While many manufacturers still stick to the 2-cycle motor, this is used chiefly on low powered, slow-spe boats having one or two-cylinder motors The speed craft almost invariably are fit ted with 4 or 6-cylinder motors of the 4 cycle type A 100 horse-power Miets & Weiss reversible kerosene-oil engine was Welss reversible kerosene-oil engine was one of the striking onjines exhibited, also a 225-horse-power 8-cylinder 4-cycle motor built for a racer by the Jeneick Motor Company The Dean Manufacturing Company showed the 8-cylinder 80-horse-power 8-cycle engine with which they made their record run from financial to the strike the s which they made their record run from Bi, Louis to New Orleans sat year in the "Brer Yox II" The Standard Motor Con-struction Company exhibited a complete line of motors, including the 18-horse-power double-acting 8-cylinder engine power double-acting experiment on its submarine. The smallest and light-est marine motor exhibited was the Wa-terman 12-horse-power 4-cylinder motor-shown in a small 14-fost boat intended for a young lady This motor weighed about 100 pounds complete. One of the shoet 100 pounds complete. One or the novelties of the show was an inclosed fly wheel having pockets around its peri-phery. The discharge of the exhaust into these pockets helped to turn the motor, these pockets halped to turn the motor, the flywheat lites acting an amufler. A new form of times, constituing of a simul legislate was established. A specialty built implication that the state of the simulation of the simulatio

(Chooledes from sage 202) bont, two men expect to make the has arious 7-mile trip through the rapids and the whiripool next summer to Lewiston.

Canada
The motor beat industry, as mirrored by the 1910 show, is increasing by leaps and bounds. Already there are 80,000 motor boats in use in this country, and it is safe to say that by the end of another year this figure will be materially Incres

The two general views of the Boston aeronautic show reproduced herewith will give our readers a good idea of how well-filled was the large hall at Mechanics Building with the machines of Americas inventors at the recent show While a the lines of some of the successful European models, most of them were pattern after American models, such as the Cur-tiss and Wright biplanes and the Pfitmer monoplane In one of our illustrations a monoplane on the general lines of the Bieriot (the "Morok") with the sliding wing tips invented by Pfitsner instead of wing warping, appears, in the foreground, while the large Antoinette type with triangular body and the smaller Ble angular body and the smaller Bierrot type monoplane were both exhibited by the Scientific Aeroplane and Airship Com-pany of New York Both of these ma-chines were constructed by Stanley Y. Beach

Another general view of the hall shows the former of these two monoplanes in the foreground Another monoplane of original construction (the "Burlingame") appears in the distance, while hanging from the ceiling is a biplane glider constructed and used by the students at Bos "Tech," and just below this another tion "ree", and just below this another glider built by two boys after a description published in the Scientific Assentant The balloon "Boston" the club balloon of the Aero Club of N S. is seen partially inflated in the center of the hall, while on the right-hand side are seen several balloon baskets, among them be-ing that of Leo Sievens's small one-man balloon "Mercury" and the banket of a 160 000-cubic foot balloon capable of

carrying 20 passengers.

The l. A W biplane and revolving cylinder 2-cycle motor was one of the novelties of the show This biplane was constructed somewhat on monoplane lines there being a rectangular body extending out behind and carrying the biplane hort sontal rudder for steering up and down The motor was mounted on trunnions The motor was mounted on Irunnions close in front of the main planes, which mounting makes it possible to direct the mounting makes it possible to direct the propoller upward slightly when the machine is running along the ground in order to rise. The new revolving-rylinder motor used on this machine is said to one of the lightest motors of this type yet one of the lightest motors of this type yet produced. It is soon to be put on the market in two closes of 60 and 100 horse-market in nower

photographs, there were numerous other full-size machines. Most of these were described in our last issue. A Farman described in our last issue. A Farman machine like that used by Farman at Brighton Beach in 1908 was put on exhibition when the show was half over machine was the only aeroplane said to have made a short flight previous to the opening of the show

## THE VERALANCED BULLET.

(Continued from page 205) based, indicated plainly that the ca so simple after discovery, was not sween surmised. Their attempts to reduce it were based upon the theory that the blast of powder gases at the musics, or some condition of the rifes here at the numeric, was responsible for this apparant sudden change in direction of the builders light at this place. Pervisitent screen sheeting and comission of comparison of compa so simple after discovery, was not ever

(Concluded from page 210) arly that this X wn, indicated cles egyor was not the only error Another chase was at work which added to or subtracted from the X error, and while experimenting for this the author desig

mated it the "Y error."

He had known for years that tipping builets make a spiral flight as they pass rough the air E A. Leopold deter-ned the diameter of some of these spi rais several years ago it was generally believed that a builet often makes a spi-ral flight over the range, and the cause of this Y error at the target seemed to ante some connection with this spiral in the air, which nearly all unbalanced bullets describe. The author's own screen abouting exhibited clearly the diameter of many of these spirals and the distance from the mussle at which the spirals commenced He found the cause of the Y error to be as simple as the cause of the X error

The X error spiral ends at the musale, while the Y error, in the air, commences about 12 feet from the musale. The bulabout 12 feet from the muzzle The bul-let makes an apparent change in its direction when it lear es its X spiral at the azzle, and it makes another change in its direction when it goes into its Y spireal The resistance of the air upon a tipping bullet produces its air spiral, and the rigid walls of the rific barrel pro-duce the X spiral described by an un-balanced bullet in the bors. The pitch of the X spiral, or the distance of one turn of the spiral to the next, is the me as the rifle twist which for a 032 caliber is about 12 inches The pitch of the Y or air spiral is about 46 feet

the f or air apiral is about 45 feet.

The diameter of the bore spiral varies from a fraction of a thousandth of an inch to several thousandths of an inch.

The diameter of the air spiral varies from a few thousandths of an inch to 7/16 of an inch, depending upon the amount the bullet tips in its flight. The amount the bullet tips in its night. The air spiral, of course, results from the fact that the tipping bullet does not point in the direction of its flight.

The causes of these two errors, X and

F, are the same in principle, but their positions are reversed. The workings and explanations by actual experiments, well illustrated, are set forth very elaborately by the author

racety by the author. The following vonclusions may be drawn from the book in careful rest target work, under favorable shooting conditions, the X + Y error at the 100 or 200-yard target is about 80 per cent of all errors. The X and Y results from the fact that the following the form the fact that the about 80 per cent of all errors. The X and Y results from the fact that the tangent of a spiral  $(c \cdot t)$  forms an angle with the axis of its spiral  $(d \cdot d)$ , as may be seen in Fig. 3. The bullet as a whole makes a suiral flight while in the rifle. because it is unbalanced or because does not lie central and straight with the does not lie central and straight with the bore it makes a spiral in the air be-cause it is a tipping bulle! It is a tip-ping bullet because it was unbalanced when it left the muss! The unbalanced bullet, with respect to the center of the -fife bore, is therefore the prime cause of its X and Y errors

To overcome the error which is inhe-rent in the rifle and its ammunition, the rent in the rife and its ammonition, the bullet, before being shot, must be a bal-anced one, that is, its center of gravity must coincide with its center of form The powder charge must produce uniform pressure from shot to shot. The rifac-barrel and ammunition must be so con-structed that the projectile remains bal-snowd throughout the entire bere

have a projectile start from the sie in the right direction, that is, in the line which forms the center of the bore, the entire bullet just as it leaves ours, the entire united part as it serves the mustle must be symmetrically bal-anced around the line of fire. Any rea-sonable rifleman would admit this last statement. What the author's work has disclossed, however, is to point out clearly the fact and its importance, and to show mathematically that practically the whole error at target attributable to the mod-win rife and its ammunition originates in the unbeisneed projectile.

WANTED the functiones size declines as the function of the fun

#### THE "WHIP-CREATION' BATTLESHIE

Ilk Washington correspondent who is re-sponsible for the distribution of payal and military news to the daily press of the country has been writing some extremely silly nonsense about the two battleships which the silly nonsense about the two battleships which the House Naval Committee has recommended for this years programme, and he has put into the mouth of Secretary Meyer statements as to the objects which have impired the request for these two powerful was have inspired the required for these two powerful wa-scle which we are privedly antified the Servery could never have uttered. According to the dispatches the motive responsible for their unspre-electrical size, reserved to be from \$80,000 to \$3,5000 toms, is the desire to balled a couple of ships which shall be blacer than anvihing class affect and give to this matter the present of size affect and give to the latter than anvihing class affect and give to the increase of the size of powership kattleships which in respect of size and term producing qualities shall be supermeds of the ship creation of our

be superned of the with contino oder.
It is sufficient to say one and for all that the day
of white cention southment has long ago passed if indeed it seer existed except on the street or in the
music half ballad. Certainly it was never a motive in If indeed it exist existence except on the street of it the music half balled. Certainly it was never a motify in the uphatiding of the United States may. Our frig. ates of the sailing days were built swifter and armed stronger than the ships then affort in other navies not for the valuations of being able to say that they were swifter and more heavily armed but for the ters practical purpose of overtaking the enemy bring ing him to action and crossing him by superior gan The policy of that early time has been the policy f our navy in the intervening one hundred years at it is its policy to-dry. If Secretary Meyer believes it to be expedient to build a ship many thousand tons larger than anything contemplated abroad we may rest assured that it is because he and his mival ad viscis believe that to maintain our traditional su performs in gun fire we must most up from the 12-inch to the II inch gun and increase our displacements in proportion

most efficient bartleship is the one which et bodies the maximum amount of all round military of ficiency on the minimum amount of displacen Unless the present theories of naval designers very much at fault, a ton of displacement in a big battleship gives more military value than it does in battleship gives more millitary value than it does in a abip of smaller size. Thus 2000 tons in a Deliavarr is a more valuable asset than the same displacement in two "Gresons". Here then is another cause of Bell-Yamid growth in recent vases in the tonnage of the first-lines fighting sith j. From the 12 500-ton 'Maline' our ships of the first-line line recent value to the 16,000 tons of the the 16,000 tons of the "Commercial value" in the 200 decision of the tempercial value of the 200 decision of the 150 decision of the 150 decision of the 150 decision of the 200 decision of the 150 decision of the 1 Arkansos and Wyoming' which are now upon

the stocks

The big jump of 25 per cent in displacement between the "Connecticut and 'North Dakota" was due
to the coming of the dreadnought type and the adoption of an exclusive main armament of 12 inch guns day we are on the eve of another great advance, rouny we are on the eve or another great savance, and again it is due to a great increase in the weight and power of the battery this time by the substitution of the 14 inth for the 12 inth sun. The House Committee on Naval Affairs has accepted we are glad to see the Secretary's programme for increasing the force of the navy by two battleships two fleet colliers one renair ship and four submarines of a new type ual speed and steaming radius. According to risions, the battleships are to be of at least 28. the provisions, the battleships are to be of at least 25-000 tons and each ship is to carry ten 14 inch guns, the

thips being made of sufficient displacement to carry this battery. The 14 inch gun, however, with its mount ammunition, etc., is so much heavier than the 12 inch that the new vessels even though two less guns, will have to be of at least 28 000 tons displacement, and if it should be decided to mount twelve such guns, the displacement may run up to 30 000 tons and over Because of the greater punish ing power of the 14 inch gun at long ranges, a bat tery of ten 14 inch would greatly outmatch one of twelve 12 inch. There is no ship affoat or contemplated so far as we know, among the nav among the navies of the

OME very remarkable (estimony has been elicited by the Joint Committee of the Legislature which is investigating the extending the jurisdiction of the Public Service Commission to and over telephone and telegraph companies it is remarkable as seeming to indicate that in spite of the large amount of thought, in-genuity, and mechanical skill which have been dirested with marked success during the past few decades to the improvement of the speed and lowering of the cost of telegraphy practically the whole of the business of the big telegraph companies is to-day sent business of the big (elegraph companies is to-day sent lo the hand-operated Morse key, in much the same way and at no greater speed, than when Morse first under telegraphy a practical commercial art. Thus, according to the testimony of Col Clowry, president of the Western Union, the maximum speed of transm is obtained in their service by two systems the Wheatstone and the Barclay the former having a capacity of 125 words per minute, and the latter of 40, with an average of about 50 in practical use. and these two forms of apparatus, it would seem, represent the only departure made by the Western Union Company from their almost universal practi of operating by hand by the Morse key

Side by side with this evidence testimony was lyen that rapid telegraphy systems have been given that rapid telegraphy systems have been developed here and in Europe with cause ities of from 500 to 1000 words a minute and over one system.

(stablished in several centers in the United States
being now in dully use which is sending message. leting now in dulity was which to some an account at a rate of 1000 words per minute. The public will unturally nak if such high speed he possible why do not the tote graph companies make use of the system and so turn us their capacity and make the conand so liter by 1967 spiritry and unite the cer-responding derroas in rates. In his testimony (of Coxyy explained that the Western Informatia and unexage business and that the company cannot hold messages until they sed a sufficient number to send in 1000 and uniture rule this is true as re-gards the single short message. But in the case of the longer massages approaching the manuscript letter length the type of business which would be certain of enormous development if it were offered to the public throughout the whole twents four hours of the day at the low rates which would then be possible -it would be proclicable to set half a dozen operators at work simultaneously in punching the sending tapes and the message could be sent through in less than one cent the time that it would take by the present methods The transmission of Peary's 8000-word sage from Indian Harbor to the New York Times was quoted as a great feat in telegraphy. It took a of twenty operators three days to get the mema By the rapid telegraphy system the same through message after being prepared on the tape could have been sent over a single line in about ten minutes Ilma

The high speed methods as worked out b The high speed methods as worked out by Hughas, warray, Polisk Virsa, and Delang chaim to send at the rates respectively of 4.500, 15,000 \$15.000 \$15.000 and \$6.000 area per hour. The significance of these methods to the public is that by their use the telegraph could be extended cheapened and popularised until it was as available to the ordinary vittem as the armore highly developed telephone of the present

NEW YORK AND PARIS SURWAY STRUMS COMPARED. YEW YORK CITY is justly proud of its subway system, but it will be a surprise to some of us to learn that the subway system of Paris us to learn that the subway system of Paris actually carries a larger number of phasengers during the year, the total being 333,000,000 as against 200,000,000 errirds on the New York system. Outside of the mere fact that more people were carried the compactions is entirely favorable to the New York subway. The details of the following comparison have been worked out by R II withing, the faulthicken of the New York Public Service Onomission, and they afford upon a most timely subset a basis of valuable information, which are subset of great services to the Commission in the Important were of great services to the frier and cannot rail to or great system to the Commission in its important work of regulating transportation mattern in this city. There are certain points of similarity between the two subways. Both have been built and are owned

by the city, and both are leased for a term of years to an operating company. The longth of the two systems in miles of single track operated was in 1869; the year for which the latest figures are savallable, very nearly equal. But the Paris system, which is entirely two-track, forms a network of lines covering a district having a radius of three or four miles from the business or traffic content, whereas the New York system has a single seen terminating in two long forts tem has a single stem terminating in two long fortex at the upper end, and extending 14 miles to its most distant point from the Brooklyn Bridge, which may be called the chief traffic center. The Paris subway has no express service, whereas the New York subway has four tracks (arrying express and local service for six and a half miles through the most congested trici

The population of the district served by the subway system was 2,750,000 in New York and 2,790,000 in Paris The area of the city proper of Paris immedi ately tributary to the subway is 31 square miles, the area of Manhattan and the Bronx served by th way is 62 square miles Hence the population of the district served by the Paris subway is more than twice as dense as that served by the New York system. There is a total of 646 miles of single track in the New York and of 622 miles in the Paris subway

yew ork and or \$2 2 miles in the Paris subway. The great superiority of the New York system is due to the frequency of the trains and the higher speed of travel in Paris during 1908 the least headway during rush hours was 2 minutes and 33 seconds of the paris of th way during russ yours was a minutes and on sevene and the greatest 1% minutes. The least headway in the rush hours of the express trains in New York was 2 minutes and the greatest 4 minutes. The max mum length of the Paris train was 236 feet, of the New York train, 411 feet. The average speed in the Paris subway is 12 miles per hour, and in the New York subway, 18 miles per hour, the average speed of York subway, 18 miss per hour, the average speed or express trains between Brooklyn Bridge and 88th Street being about 24 miles per hour and the average speed of the local trains about 15 miles per hour. The maximum speed in the New York subway is 40 miles per hour, as against 217 miles per h

The rates of fare in Paris are first class 48 cents. d class 29 cents and second class round trip tickets 3.8 cents equivalent to 19 cents per trip York there is a uniform fare of 5 cents, but while the fare in New York is 5 cents, the average length of ride per passenger is from two to two and a half tir

In Paris the capacity of each car is determined by the government, and in 1908 the average number of passengers per car was 64. The capacity of the New York cars both scated and standing estimated on the Paris basis was 103 but this frequently rives to 150, and even 170 passengers per car. In Paris the num-Pails basis was 101 but this frequently riess to 100, and cven 170 passengers per car. In Paris the number of standing places is fixed by the government, in New York the limit is apparently fixed by the ability of a burty platform guard to boost the passengers in of a burty platform guard to boost the massengers in by a well-directed football rush. But wore the gov-rrament allotment of floor space, as obtaining in Paris applied in New York, the maximum capacity of a New York sulway car would be cut down from 170 to 103 The number of passenger place-miles per mile of track was 73,000,000 for New York and 38,000 000 for the Paris system, and yet as we have seen above the Paris subway, because of the shorter length of the trips carried a greater number of passengers in the

Year Congestion in Paris is not nearly so great as in New York, first, because traffic is more eventy distributed throughout the day, secondly, because the currents of traffic in Paris move in both directions during rents of trame in Paris move in both directions during the rush hours, and thirdly, because the passenger in Paris takes a shorter average ride, and vacates his place for others. The longest possible ride on the New York subway is 17½ miles, though it is not proble that many people take the trip from Atlantic Avenue, Brooklyn, to 222nd Street, New York, for the Avenue, Brooklyn, to 222nd Street, New York, Nor the pleasure of the trip, and certainly not many for busi-ness purposes. The total cost of the New York sub-way and its equipment was \$87,928,000, consisting of \$61,280.00 actually paid by the city for the construction of the subway and \$58,648.000 that the company claims to have expended for both equipment and construction, including \$10,048,000 which it claims to have spent in the construction of the andway from Brooklyn Indian half. to have spent in the construction of the subway from Brooklyn Bridge below Broadway and the East River to Brooklyn The total cost of the construction and equipment of the Paris subway is estimated at \$62,353.

The New York subway fared much better this Paris subway in the master of taxes, the former paying but \$900 per mile of single track as against \$4,300 per mile paid by the Paris subway The New York per mile patid by the Paris subway The New Years, mbway considered as an economic undertaking earned about 7 per cent on the capital javested, while the operating company carread about 7 were cet on its reported intestment. The Patit subway caused 7% per cent on the total estimated coet of conputries and equipment, and the operating company carreed 5 per cent on its reported javestures.

### ENGINEERING.

A recent wreck in the London & Brighton Rallway, Ragizand, when an express left the rails and crashed hato the relitway station, has again illustrated the light construction of English cars A Pullman car was comparatively little damaged, whereas the ordinary day coaches were completely wrecked.

The new single-phase electric freight locomotive which has been built for the New Haven Railroad was recently given a test between New Rochelle and Stam ford, a distance of 17 miles. The load consisted of thirty loaded freight cars, and the distance of 18 miles overed in 27 minutes without pushing th to its full capacity

In a paper before the Engineers' Society of West ern Pennsylvania, E. F Bulmahn described a new type of bituminous gas producer which embodies the good features both of the speriart and the down-draft type corrossing the production of tar and comploidly con-cernousing the production of tar and comploidly con-cernousing the production of tar and comploidly con-cernous the production of the product of the pro-ton operated as a down-draft producer to break up the westlett matter, the other as an underst morderer to one operated as a construct producer to consume the fixed carbon, the resultant gas being taken off at the center of the producer

## DRIVING PILES WITHOUT A PILE DRIVER

BY GEORGE H. LODGE

It may be of interest to many of the readers of the Benerive American to learn of an easy method of driving piles through the ice without the use of

Those who have tried to drive even by hand while working in water or from a small boat have found it much more difficult than one would at first suppose. I was myself confronted with the problem of building a dock landing for a lake steam boatt- a steamboat built to carry 300 passengers, be-ing 70 feet long. The problem was to build a dock or landing safe and large enough to handle the people

First we thought that it would be necessary to hire a pile-driving outfit, but my father, R II Lodge, devised a plan that works to perfection

We select straight white oak piles not over one foot

We asket straight white oak pites not over one root in diameter at the butt which are cut to the length required usually from 20 to 36 feet. These are sharpened at the butt ends to a point and with an ax a thread is cut from the point of the attek back from three to four and one-half feet, according to the size of the pile

It is important that the threads be cut as nearly the same distance apart as possible A good man with an ax can soon cut threads that are mechanical. tonishing how many, with a little practice, can it is assumenting now many, which a fitted practice, on the cut in a day. It pays to use special care in the cutting, as it helps wonderfully in the driving. Piles that are from ten to twelve inches in diameter should have threads from three to three and one-half inches apart and two to two and one-half inches deep

apart and two to two and one-nair increa ones After the threads are cut the pole is ready to drive, which is done by chopping a bole through the ice at the desired apai, being careful not to make the hole over two inches iarger in diameter than the pole, and have the ice act as a guide to keep the pole upright

this screwing it down

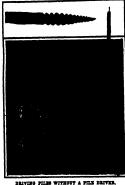

If the pole is long and heavy, it is not fasten three guy ropes to the top of it before raising After the pole is raised, it is an easy matter to keep

it plumb by pulling the ropes

The pile is raised like a comm The pile is raised like a common telephone pole in other words, a little at a time with pike poles, follow ing up under with two planks spiked together in the form of an X.

form of an X.

It is a good plan to stand a plank in the hole and to let the point of the pile rest against it, as it assists in placing the pile in the desired spot

It is also a great help to spike a short plant the pile, temporarily, just above the threads, to keep the pile from shooting under the ice before it is vertical whereupon it may be knocked off. The pile

will then drop into the proper place Now you are ready to bind a pole (or sweep lever)

to the pile. This is done with a common log chain, care being taken to bind it so that it can be screwed in the right direction. Hitch a sharp-shod horse to the outer end and tead him around the pile (capatan

It is an easy matter now to serew a large pile from four to eight feet into solid clay or gravel or to unscrew it and remove it

serve it and remove it.
The accompanying photographs illustrate the wooden threade ready for use, and the plan of servering in a left hand threaded pile by the all of a borne. We often put in smaller poles by hand, using two of them man instead of a borne.
We have recently taken out two steamer its posts that have been in use for eight years, having begun to decay. These unserved point we found had been in the contract of the

To the Cairo Scientific Journal for January last To the Cairo Scientific Journal for January hast IF B F E. Keeling communicates an interesting paper on climate changes in Rgypt. There is a strong builed among residents that changes have occurred within the last ten or twenty years (possibly due to increased irrigation) which are distinctly "sensible" without the aid of instruments. Mr Keeling quotes the man temperature at Abbasis for each pertade from 1870 to 1994, and for the four years 1995-8, which the results show that the differences are hardly greater than might be caused by difference of expo-sure of the thermometers. As regards humidity, also, sure of the thermometers. As regards number, used, there is very little evidence of any decided change during the last forty years. It is confidently asserted by many persons that the rainfall has increased during quite recent years, but the author shows that there ing quite recent years, but the author shows that there illtile, if any, evidence of ruch being the case. The total rainfall of any year is often influenced by the form one year to another. Due of the form one year to another, the offent year on record at Abbassia is 1889, with little more than a quarter of an inch or fain, and the wetter, 1904, with less than 3 inches, the mean for 1887-1808 being approximately 1.4 inch.

### AN ARTISTIC REINFORCED CONCRETE BRIDGE

#### A COMING TYPE FOR COUNTY HIGHWAY BRIDGES

In country districts where the materials are r this the reinforced concrete bridge should prove to be an ideal system for the construction of concre bridges of moderate span. We say of moderate span, for the reason that the art of trussed bridge construction in reinforced concrete is as yet in too early a stage of its development to warrant its indiscriminate use in bridges of considerable span in structures of moderate length, say up to about eighty or a hundred feet, if care is taken in proportioning the parts, espcially at the joints, and very particular care is take

in securing a thorough bond between concrete and steel, the county com missioners or other au thorities should find the concrete steel bridge a reliable and economical type. It is easy to erect, it requires no painting and practically no mainten ance whatever, it is in destructible by fire or the action of the weather, and its subsequent cost for maintenance should be maintenance practically nothing at all

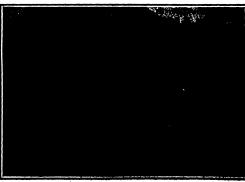

The accompanying illustration shows a bridge of this class of the bow-string type which was recently built in Canada. It has a span of 80 feet and provides a clear roadway 16 feet wide. The total weight is about 160 tons, and it contains about 19 tons of reinforcement in the form of plates and round rods.

The bridge was designed to corry a load of one bundred pounds per

square foot evenly distributed, and it was tested for this load with an additional load of 35 tons represented by a herd of 70 cattle

On the score of appearance it must be conceded that the design is decidedly pleasing the intersection of the balustrade with the chord and web members having been worked out with considerable taste. The structure spans the Etobicoke River, in the counties of York and Peel, Canada

No sooner had the first modest attempts to steer

. A RELEPORORD CONCRETE BRIDGE OF ARTHUR DESIGN.

ships by serial electric waves b or less success, than endeavors were made to direct the course of balloons and seroplanes in the same manner. The American engineer Anthony has made experiments off Sandy Hook, with a small unmanned dirigible balloon, which he succeeded in guiding more than a mile seaward and bringing back to the point of departure Prof Wiechert suggests the employment of departure Prof Wiechert suggests the employment of unmanned aeropianes for the study of atmospheric electricity and has designed an apparatus of this kind It is obvious that such an apparatus, equipped with

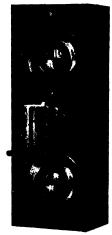

the necessary instruments, which could be sent to which could be sent to great heights without dan-ger and brought back with certainty, would be much more useful for the study of the atmosphere, as especially that of atmo and pheric electricity, then unanned registering manned regardering mar-loons, the recovery of which is always a matter of chance, or manned bal-loons and kites, the use with danger in storms weather Balloops con-trolled from a distance by electric waves would also be very useful in the res-cue of shipwrecked per-sons and for many military and other purposes. But -and this objection applies also to the wireless direction of ships and torpodoss—it is a long step from successful sorep from successful co-eriments in terorable con-litions to apitions suc-

## Instrument for Detecting Violations of the Speed Laws

BY L. GORDON GLAZIER

A very ingenious instrument for recording the speed and license number of an automobile has been devined by two instructors of the Massachusetts institute of Technology The instrument, which is but little larger than a pocket kodak, consists of a double camera with a watch movement which controls the consensus of the camera but the ca

nmera with a watch movement which controls the peration of the camera shutter When an automobile passes at a speed that seems committee, the operator trains the instruments upon and releases the mechanism by pressing a button, manediately the shutter of the upper camera is sprung

DOUBLE CAMERA WITH WHICH VIOLATIONS OF THE SPEED LAWS ARE DETECTED.

taking a photograph of the receding automobile, and a moment later the other shutter is sprung, taking a second image of the automobile, whereupon the timing mechanism comes to a stop. The plate is developed by the regular process, and the resulting negative shows an image of the automobile near the operator with its license number distinct, and a second view with the include taken at the end of the time interval.

In the center of the print are the photographs of the hands of the stop watch caught when the first and second exposures were made.

Since the automobile has traversed a certain space.

in the time interval, the second image is smaller than the first by an amount which can easily be measured with an ordinary scale, divided in bundredths of a lach; and knowing that the standard whoel tread is 56 inches, the distances of the two objects from the 55 inches, the distances of the two objects from the camera and hence the space the automobile has covered in the time interval is easily found by the following law The distance of any object from the lens is as many times greater than the focal distance of the camera as the length of any line of the real object is greater than its length in the photograph. This is a simple proportion in which three of the terms are known namely, the size of the object the size of the image of the object on the plate, and the distance of the image from the lens. The fourth term of the proportion, the distance of the object from the lens, follows by simple division However, the operator is saved all irksome computation by a table attached

to the instrument

To overcome the possible objection by the courts,
the watch has been designed so that the operator of the instrument may actually see it during the process of taking the picture. This is made nossible by sim ply boring a hole from the outside of the camera box to the back of the watch, which brings to view a dial around which travels a band attached to the same pinion or staff as the regular band of the watch in order to see this disl more plainly, two mirrors have been placed permanently in such a manner as to illuminate it.

The instrument gives extremely accurate results, and can be calibrated from time to time on objects of

The inventors believe that the instrument should be welcomed by autoists as well as police It is an im-partial judge the personal element being entirely eliminated A motorist who has been stopped does eliminated A motorest who has been stopped on not have to rely on an officers estimate of the speed, nor on the speed claimed by the officers operating a trap by means of stop watch and signals. Someon of motorists are fighting tases every day who honestly believe that they were not overspeeding when stopped. They would be perfectly willing to just their fines it convicted they were violating the law. Even stopped They would be perfectly willing to gave their fines if courtneed they were violating the law. Even where the more rational view is taken that the speed alone shall not determine whether or not a man is violating the law, but that the speed taken in connection with the surroundings shall determine it it is tion with the surroundings shall determine it it is atways a question of the officers' word against the autolat's as to surroundings. This photographic speed more the automobile whether people were crossing the street, whether it was more than ordinarily dan-grouns to run at the speed indicated, or more than ordinarily safe. A great advantage of the instrument is that it rec-

A great advantage of the instrument is that it re-ords speed over a short distance in the congested portions of cities, near crowded cross atreets and in similar situations, it offers the only existing method of measuring momentary bursts of speed The record of any reckless driver can be easily obtained and a print sent directly to him, when he cannot deny the evidence of his own eyes, and in many cases an ar rest will not be necessary, as the offense will not be

Regarding the legality of this speed recorder in a recent case that was strongly contested Judge Ham

mond of the Massachusetts Supreme Court said "The result of the evidence did not depend upon the fluctuations of human agencies nor on conditions where relations to results were uncertain, but upon the immutable working of natural laws, and upon the

SPEED OF AN AUTOMOBILE SHOW COMSECUTIVE PROTOGRAPHS

evidence the presiding judge may well have four that such experiments were likely to be more reliab as to the speed of the automobile than the conjectural ent of an eyewitness or the interested

## Sacrificial Compliments Paid to New Hulldings in Antiquity. A superstition that still envelops a great part of th

earth is that especial firmness may be given to a build-ing and that it may be protected from hostile infuing and that it may be protected from heetile infla-ences by inclosing a living creature, preferably a ha-man being, in one of the valle of the building itself. This belief, which is particularly prevalent in the Bulkan peninsula and, for instance, has given to the Roumanian Queen, Carmon Styre, Rabertal for one of her most beautiful folk takes, has not been known as baving had any hold in Italy hithestro Recently, in having had any hold in Italy hitherto Recently, the the course of archaeological research, it was found that in the foundation of the Tumple of Fortune in Feunpell there was a holden space in which nothing other than the shall of a tortoise was found which time had breish not four prices. Here, conceptently, was pred of the practice immurement of a tortoise, which was eshamed by the disposition of the square holden of stone of the creature's prince. In Italy this superstition may have peaced at an early day into oblivious, as the smeatice of human beings was forwign to the Roman rediging and was preduced containabily and yearly engine, being and was preduced containabily and yearly engine, being many the contained of the state of the st

believed that in old Greece also the sarrificial com-pliment to new buildings was not unknown instances of this kind of sacrifice in antiquity are certainly not frequent, all those of which we have any knowledge are or time aims or sacrines in antiquity are certainly not frequent, all those of which we have any knowledge are attributed to the Greek Orient. Usually a maiden was sacrificed who, at the same time, became the guardian apirit of the structure For this reason Trajan effected appril of the arrector For this reason trains encoure the erection in the theater at Antiche of the statue of the girl who has been sacrificed on the occasion of the reconstruction of the city after an earthquake and was designated as Tychs, the Goddess of Fortune of the scene of her sacrifics. It is this ides which still lies to-day at the root of this superstition of sacrificial co pliment. Solidly a human being is incased in a wall of a bouse or other building, so that its soul may live in the structure and nover escape from it. At the in the structure and never occape from it. At the present day a ricefrois sacrifice takes the place of such immolation. The human sacrifice is practiced appelluishing the measure of a person, or of the shadow, and immoring the string representing the measure or by innealing in the wall as animal siready killed or still alive. Manifesty the work of the proposed of the present of

When death is caused by hanging what propor when death is caused by analying war proper-tion does the pull to which the rope is subjected dur-ing the struggles of the victim bear to the weight of the body? This novel question has been asked and answered by experiment by Dr Angelo de Dominicia. answered by experiment by Dr. Angelo do Dominicke. The testion in such case was measured by a dynamo-meter attached to the rope. A living dog, suspended in such a manner that it remained quiet certified as pull of 20 pounds, but the subsequent "hanging of the same animal produced a pull of 42 pounds. With a larger animal the corresponding tensions were 50 pounds and 103 pounds.

Hence it appears that the convulsive movements of the victim may increase the tension of the rope to more than twice the weight of the body. This result explains the occurrence in the bodies of persons killed by hanging of serious lesions which it would be dif Scult or impossible to produce by hanging up a corpse. The strength of the rope must size be taken into account. If a body is found suspended by a rope the breaking strength of which is little greater than the weight of the corpus, it may fairly be inferred that the body was not suspended until after death Hence the experiments furnish valuable data for determining the cause of death in such cases and will pumbably be made use of in some future detective story.

## JUPITER AND HIS SATELLITE

### BY PROF. FREDERIC R. HONEY, TRINITY COLLEGE

Jupiter and his satellites comma supers and his satellites command expects attention at the present time, owing to the fact that this greatest of all the planets and second only to Venus in brilliancy, is approaching opposition which will be reached on March 30th Jupiter will then be

be reached on March 30th Jupiler will then be both morning and ovening stars are The comparatively recent increase in the number of Jupiter's accellities from four to seven and pos-sibly eight as revealed by the growing power of the telescope directs the attronomers curi one scrattin upon the Jovian system. The

satellite which is nearest the planet revolves around its great primary in the short space around magnat primary in the short space of twelve hours, at a distance of only 88,400 miles from the surface, while the outer most moon shows its extreme remoteness from its center of attraction the enormous distance of 7430000 miles) by a revoludistance of 7.430.000 miles) by a revolu-tion requiring 256 days. Thus is exempli-fied a perfect conformity to Keplers laws. A small magnifying power reveals the elliptic outlin of Jupiter, whose polar depression is a reput y marked the equatorial and polar diam-eters showing a difference of over 5000 miles.

in the plot of the orbit Jupiter's position is in the plot of the orbit Jupifer's position is shown for the date of coposition, which is very near sphellon, also for the oppositions from 1902 to 1911 inclusive The-average interval between oppositions in 339 days, But, in obsolutors to Keyher a second law, the planate velocity at sphellon is distributed by the curred or Provengy 21th, 1908, and the next will occur on April 30th, 1911 At perihelion the voicity was accelerated in the date of the opposit tions, which occurred before and after the holion passage were respectively September 11th, 1903 and October 18th 1904

The five inner satellites revolve in orbits whose planes very nearly coincide with that of Jupiters equator This plane forms a small angle with the ecliptic, and may be represented approximately by a straight line (Fig 1) The distances from Jupiter to the satellites are represented by the same scale as the planet. It is impossible to show the positions of the two outer satellites by this scale within the limits of this page, since their distances from Jupiter

of this page, since their distances from Jupit are over six times the between the plant at Calliste. It should be noted that all t satellites are negar, on the same side of the planet at the same time, as shown in the figure. This view of the satellites orbits is obtained when Jupiter reaches the positions. A and B shown in the plot of the orbit. When Jupiter is near either of these points, the five satellites appear to move back and forth in straight lines, and at every revolution of each satellite there is alternately a transit across Jupiters alternately a transit across Jupiters and disk and an occulation by the planet. Fig 1 shows Jupiter and the orbits as each from the earth in 1908 in 1902 this figure was reversed During Jupiter's revolution around the sun in 1185 years, the planet and the satellittes are continually changing their positions retailing the continually changing their positions of the orbit is incited at an angle of 13 dee, and that next which that per which the property of 12 dee, and that next which the planet in the planet. of 13 deg, and that part which is above the ecliptic is represented by the full line. The line joining the points N and N. (the ascending and descending nodes) is the intersec-tion of the plane of the planet s orbit with that of the ecliptic In Plot 1 a visual ray A from the earth tan-gent to the planet shows that, seen

and to be placed on the control of t

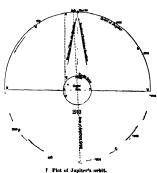

the satellites the general directions of the lines of vision from the earth before and after opposition are indicated by arrows.

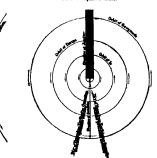

Obviously the planet does not occupy the same

position in its orbit as that shown in the plot before and after opposition. But if this page be rotated clockwise and counter clockwise through small angles, one position will represent Jupiter in his orbit before and the other that after opposition Before opposition

That the controlling devices for a single-phase car equipment need not be more complicated than for a direct-current car, states the Electrical World, will be apparent at once from the fact that any of the methfrom the fact that any of the method on now used with the lattice type of our can be applied immediately give the control of our can be applied immediately if a reflore that by selecting a suit-aby low value of rouldy B. M. Farmer of the famility arrisage ment of motors with rhosentate acceleration can be applied to series motors of the suited-phase type equally

plied to series motors or the single-passe type equaty, as satisfactority as to those of the direct-current type. Moroover, with the alternating-current equipment it is possible to substitute reactance coils for the residence of the rheostats, and thereby eliminate a considerable of the rheactait, and thereby eliminate a considerable portion of the seary dissipated as best in the embyd protion of the seary dissipated as best in the embyd circuits during acceleration. In addition, with the single-phase or favor can be obtained, convaniently, any desired number of rollages to be happened upon the motor circuits, and there is thus no bichmostly for limiting the E. M. F. to a single value, six sizes in deas with direct-current equipment, "be that limited one with direct-current equipment," but his limited with the control of the contr

#### A RESTARDANCE PROPERTY.

To the Believ of the Scussworth Aussours.

'I have just read with interest on page 128 of the Scussworth Aussours.

Showever the state of the interest on page 128 of the Scussworth Aussours of the "manarkable phenomenon" observed by Mr. V. J. Laine, in which a rainbow was spine to be disturbed after each past of thusder Mr. Laine's explanation, based upon the change of size of the rain-drops, is apparently unwarranted, inasmuch as according to the old and generally accepted optical per of the rainbow, the angular position of the and the observer's eye, is independent of the size of

and the observer's are, is independent of the size of the rank-drops.

To the writer the phenomenon is more plausibly are plained by recognizing the atmospheric distributance in the like of sight of the observer due to the funnderboil. The light, after dispersion by and reflection from the rain-drops, passes through air which is agitated by the concessions following the lightning strokes, and the latespace sound waves radiating therefrom. The result er to that seen over a hot surface, as a or heated field, where the convection currents distort

or heated field, where the convection currents distort the light rays towersing the overlying air. While it is true that ordinary sound waves do not affect the density of the air sufficiently to deviate the course of light perceptibly, the violent expansion and contraction accompanying a thunderbolt may pro-duce the result. The possibler circumstance in the case referred to it that the storm approached from the east, opposite to the sun, so that the lightning dis-carrant, which are somerally in the advance portion charges, which are somerally in the advance portion of the results of the contraction of the contraction of the contraction of the results of the contraction of the residuous whereas ordinarily when a rain-tion of the residuous whereas ordinarily when a rainconserver and between his eye and the apparent posi-tion of the rainbow, whereas ordinarily when a rain-bow is seen in the east it is after the storm has passed over and the lightning is taking place in the distance

#### THAT CURIOUS WATER PERSONNEON.

To the Editor of the SCIENTIFIC AMERICAN I observed a similar curious phenomen rted by James S. Lee in your issue of January reported by James B. Lee in your issue of January 50th Mine was observed from a train going west through the great Alkali Desert in Nevada. The desert floor is of sand, and fait, as though laid by water Innumerable desert or beach grass mounds covered perhaps ten per cent of all the surface. These

covered permaps our per cent or at the surrace. These mounds or dunes vary from six to twenty feet in diameter by one to two feet high it was about five o clock of a warm Beptember afternoon I noticed, looking wastward and nearby, what seemed to be a small but powerful stream of water or fountain, going to perhaps twenty-five feet in height. Close observation revealed many hun-dreds of these fountains. As near as I could make drads of those fountains. As near as I could make ut there was one from the center of such of the sand dunes, varying in size much as the annd dunes varied in area. These fountains were really formed by incipient cycloses carrying annd, not water, in small streams, somewhat in the shape of slender long-waisted hourglasses, spreading at the top to full to search. These varied from twenty to fifty feet bigh. The truit was making the small rather slow desert time, which gave a full chance for observation. continued for ten miles along the line What caused than? I suppose the floor of the desert was severa thesn? I suppose the floor of the desert was several degrees cooler than the sand dues, which had been absorbing solar heat rapidly all day As evenings, approached, the warmer air over the dunes reservablely, assuming the natural spiral motion, licked up warm dry sand, and made a most heautiful ple-ture. The passengers gased and wonderd why. Will the Ridder please give the correct cause if mine, as given, is incorrect?

KERRETH MACKEREIN FORS, Lieutenant Colonel London, S. W

The Whop of Satura.

In a recent bulletin, Prof Percival Lewell of Flagand a recent bulletin, Prof Percival Lewell of Flagstaff, Aria, annouese that on Beptember 19th, 1909,
in examining Satura he noticed what seemed to be
faint lacings traversing diagnostly the planer's equatorial helt Not only was the phenomenon unprecedented, but it was no faint and illustre that he
was unable at first to assure himself of its objective
reality. On mentioning his impressions to his assistant, Mr. E. C. Silpher, he found to his our place
but the season of the contract of t

he had had suspected or the same thing on september sit, and had even thought to detect traces of it on the photographs of Saturn taken by him afterward on that day At the same time that Lowell divined rather than described the wings be saw unmistakably a fine dark irregular line running longitudinally through the middle of the bright equatorial belt, a line not of uniform character, but as if composed of

the not of uniform character, but as it composed or beads strung upon a wire. Following up the eye-high thing vouchsafed he exam-ined the equatorial belt for the wisps at moments of good definition during the succeeding days. Re-peated observation of them, both by him and his aspeaces opervation of them, soon by him and his as-sistant, eventually showed them to be facts, and then, to clinch the matter, he succeeded in getting, on No-vamber 4th, some excellent photographs of the planet in which they stood recorded, appearing in sits in suc

in which they stood recorded, appearing its after in suc-centry images on the same plain.

The manner in which the photographs are taken anables ones to eliminate on the images imperfections due the appearatus from the more drawn than the day of the vertically for the accessive images, but the colorsecreen through which the photographing is done is itself shifted at intervals during the taken of the plate. Nothing due to either cause could, therefore, perpentant itself is ails on images of the set some distance apart.

On the photographs plate the images appear east uy as they do to the eye, though of course not so well defined, to wit as wisps or filaments, fainter than the dark beits of the planet's disk, crossing the bright equatorial beit. Like all astronomic phenomena previously unperceived, they became much easier to catch after their research was known, their recomplicions. lously unperceived, they became much casier to catch after their presence was known, their recognition not being nearly so difficult as their discovery. Their apparent lack of contrast with their surroundings is for much in this, which is also why the photographs which intensity contrast brought them out. In look the inclinar resemble faint shreds of some dusty mustaters in the act of dropping, their shares of the pro-

quary substance in the act of dropping from points on one edge of the bright belt over to the other Though darker than the bright belt, they are much lighter than the dark belts from which they come a difference in tone which is probably due to their real sienderness being spread out by the light waves and so thinned in strength.

Careful accuting revealed that the wisps started from triangular spots in the dark belt, and Mr G R Agassis, who was observing with Prof. Lowell, detected that the adjacent parts of this belt were themselves erissercesed by derker lines. The triangular spots are not difficult, giving the edge of the belt in good seeing a notched or toothed appearance. It has not been possible as yet to use the wisps for timing the rotation periods of Saturn's equatorial region, owing chiefly to their number and the confusion consequent

receiving in their number and the confusion consequent pages it, but identification will undoubledly come in time and give us a more accurate value of the equa-torial agent dark was a present possess. Tainvanthy as the lacings are in themselves, they should cloudly as of firm this fact, that they aimset lyestledly plavallat the phenomena recently discovered on Jupiter, it has based on Except for Intim-ness, which flatures greater disasses, the one with factures is greater to the other. Like the Jovian, the wings seen to be hore- teamous jn the indigin of their quiese. Like the Jovian, apparatorial phagements, on, the shedial copy is more ofengiousus; than the wiste.

than the wisput. The Saturdian inclins cross the equatorial belt manality of an angle, but one which is less than that of the strenge of the Jorian ones. This angle should have something to my about the factors concerned in the formation of the two sets respectively; for analogy ja best explained by secondary difference.

The Current Supplement

A new process for reducing atmospheric nitrogen, invented by Dr. Schonherr is described in the opening article of the current Supplement No. 1784. Among the present wonders of science none stirs the imagin ation so powerfully as the doctrine that some forms of insanity are the result of a chemical change in the blood. The theory is elaborately discussed in an article ontitled, 'The Chemistry of Insanity''. The article ontitied. The Chemistry of insanity recent development of acronautics has suddenly creative a demand for large quantities of hydrogen at a low price. The subject is considered in a short article famil Kosatk writes an article on spaking magnets, speaking iron, and speaking wire. Since the experimental bombardment of the "Belle Isle" of the British have been directed against a warship in any foreign navy as those of which the French warship "Jena" was the subject last year. An elaborate article by a competent authority gives the results of the tests. W P Dreaper exhaustively reviews the artificial silk industry. One of the most recent important events in the field of prehistoric archeology was the discovery of a megalithic monument of remarkable size ery of a meganitate monument of remainance also be Biacoglie Italy This subject is discussed in an illus-irated article. In the middle ages falcony, or hawk-ing, was regarded as the king of sports, as it was the sport of kings. The origin and development of this obsolete form of hunting is discussed by Dr. Hans-Bollmer in an article entitled ' Fakoury in the Middle Bollines in an article entitled "suitorly in the shown Ages" Perhaps the most distinguished authority on the subject of previous stones in Germany is Prof. M Bauer of Marburg He contributes an exhaustive article on artificial stones which contains a wealth of sechnical information. The process of directly producing ammonia from coke-oven gas is described. Bince Davy, nearly a century ago, constructed the Since Davy, nearly a century ago, constructed the first safety langua, inventors atmost immunerable here produced lamps bearing their names but in the tiga-lority of instances the alleged improvements have been more apparent than real. A comparative est-mate of the safety of these various forms of mineral lamps is presented by J B Marsaul F W Henkel contributes an article on astronomy and astrology, in which he riddles the supposed influence of the planets upon human affairs

After three successful flights on March 2nd, Lieut B. D. Foulois in a Wright aeroplans, made a fourth attempt at San Antonio which resulted disastrously dder of the machine was wrecked and Lieut The router of the marsine was wrecked and their Poulois had a narrow escape from futry. The ma chile had just turned the southern end of the parade field at Fort Sam Houston when the engine stopped The aeroplane fell forty feet to the ground

The rock-hown obelisks of Petra.

a view is taken high up to the worth of the narrow velley called the Walry Mones (the Vale of Mones) in which the failmone rock-ent city of Peter reposed in accient times, securely shot in from stateth of the midwest times. It is row when the reason have been used with invested he was not been accessed in the control of the control of the fail to the peter of the Mones in the control of the Mones and the peter of the Mones and the peter of them. They are accessed by English per deposition of the control of the peter of

Unique among the many wonders of the Orlent and the remains of heary elvillation stands Petra the rock hewn (ity the city so graphically addressed by the prophet as Thou that dweller in the ciefu of the rock, whose habitation is high (Oland 4), and re-ferred to in the challenge of the Palmist (69 2) "Who will bring me into the strong city." Who will of the creak Acabiac desert. About midway between of the creak Acabiac desert. About midway between of the great Arabian desert about midway between the Gulf of Akabah and the Dead Sea. Other ruins such as Palmyra and Basiber, show crumbling piles of magnificent architectural monuments but in Petra, high up among the mountain crags that sentine it, are temples theaters, tombs, and other structures, strong and indestructible, standing almost as perfect as when they were chiscled out of the living rock of which they still form a part

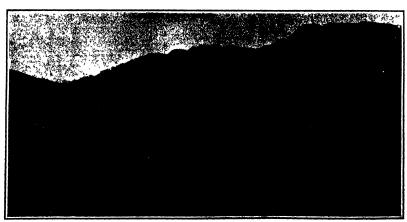

These ruins (if ruins they may be called) that lenge admiration by the variety of styles they em-body, showing, in the most ancient creations early body, showing, in the most ancient reastions early mative art intermixed with Egyptian and in the later magnifecent edifices the best types of Greek and Roman architecture, and by the exquisite hues of the sandatone from which they were hewn, varying from sangkone from which they were news, waying note the prevailing purplish red of the mountains and eliffs to the delicate pink and rose color of some strats, and the white crimson yellow and blue-ribboned veins in other places, rivaling the softness of

the plumage of birds or the pelase of flowers.

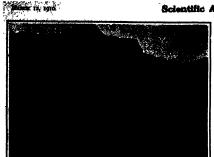

Petra, so long inaccessible because of its removers and the danger from roring Bedoutas, may now be reached by a six hours' ride westward toward the Arabah from Bi Mann, a station on the new Meca railroad Prof Gustar Dainan, director of the German Archeological School of Jerusalem and the suthor of a monumental work on Petra, has just paid another wist to this aware of his former applorations, in which the state of the state of the state of the state of the control of the other pelocity of the state of the former applorations, in which can critony in Jerusalem, who secured a number of abootsquale to these majeries rains, some of the most striking of which we here reproduce for our readors

Petra positing amid its precipices and cliffs almost in the shadow of Mount Hor, called by the natives
Jebei Harun (Aaron) from the tradition that it was
here on the top of the mount that Aaron died, is aphere on the top of the mount that Aaron sited, is ap-proachable only from the east through a deep and narrow desire which the little stream of the Wany Musa bas in past ages out for theelf in the red sand stone. The correct opens in one place to about two miles in width for a distance of about a mile, and miles in which for a distance of about a mile, and here, protected by mountains and precipiese on every ride, this remarkable town lay secure from attack from without it was its impremable position and its being on the great caravan route to the Red Sea from the north that gave it the importance it had as

a trade depot and stopping place The approach was beneath a grand arched portal at the mouth of the Sik (as the deep ravine is called), some romains of the portal being attll visible. It takes half an hour to follow the windings of the narrow path al dark ravine, which is only from 10 to 20 feet wide, threading the course of the oleander fringed stream bed until one emerges into the small open valley The variegated sandstone rocks rise precipitately on eit ting out the light of day. One of our views shows the entrance to the Sik. Another is taken about twenty minutes in from the opening, giving a good idea of the narrowness of the defile and the precipitousness of the rock walls, while beyond, where the gorge of the rock walls, while beyond, where the gorge widens a little, are seen the seviptored columns of the magnificent so-called Khannet e! Farfount (the Interest of the rock hewn mousunests of Petra being place in AD 131 and retacted here a toughe to late. ## AN ELECTRICAL FEVER RECORDE

BY DR ALFRED GRADENWITZ

Fever, 1 e , the rise in blood temperature attending certain malades is known to be the outcome of a spontaneous reaction on the part of the body against the microbes invading it the opinion is therefore, erroneous that fever is all cases should be acted against in order thus to subdue the morbid state of the patient Nevertheless it is of the highest import-ance that the physician be kept informed of the variable temperature of the blood

According to present practice temporature readings are taken at regular intervals, say there or four times a day by a sonal tise thermometer. This practice obviously alives no information as to those oscillations in temperature which may have occurred in the meantime and which, in some cases, it would be desirable to know A process allowing this important factor to be recorrect continuate and content full. These corded continually and automatically there for is worthy of universal attention. A firm of Berlin constructors, Mesers Siemens & Halske, have recently perfected an apour tus achieving this result

par the achieving this result. The apparatus is based on a very simple principle viz the alteration in the electrical resistance of platinum wire by variations in temperature. It comperises in addition to a coll of platinum wire a Wheatstone bridge and a self record

The platinum coll is either introduced into some cavition of the body or fixed on the body couble conductor of low resistance connects the coll

cultule induleror of low respirator commerts the cult with the bridge and millivolinator, which reversia any variations in the resistance of the platitum wire and accordingly the temperature of the body. The current required to feed the apparatus is sup-plied by a small storage battery of four volts, the gradual drop in tension being compensated for in a simple manner by means of a testing and regulating resistance with coarse and fine adjustment. As the remander with coarse and me adjustment. As the normal range of the recording apparatus comprises the interval be-

45 deg C the curves registered are of sufficient are of summetent distinctness for any therapoutical and scientific purpose The electrical

fever recorder is constructed in two different type In the first

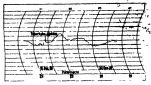

type, the rotating voltmeter is sus-pended from a strip of metal, the curve being recorded on a paper tape about 45 meters in length which is moved along by a clockwork at a speed of 20 millimeters per hour The useful width of the tape is 120 millimeters low the paper tape there moves der the action of a clockwork an luking rib-bon, over which oscillates a point-er carrying at its end a runner The position of the pointer in marked by a dot series of points

forms a distinct

The clockwork should be wound up once a week, a new paper roll being inserted every three

The second type comprises a notary coll located The second type comprises a rough continuent between points, so that the apparatus to insensitive to any moderate oscillations while not requiring accurate horizontal adjustment. The registering tapo

is wound together with a sheet of carbon paper round a drum. As in the former apparatus, a style marks time. The apparatus is designed either for a rotation of the drum (about 360 millimeters in periphery) is about 7 days or in 24 hours. The paper tape and carbon should be exchanged after each turn, which The dropping of the

Record obtained with fever recorder, showing effect of tubriculla ignition

in accordance with the rotation speed of the drum. and takes place either every 12 or every 2 minutes in order to allow for both speeds, the apparatus can be fitted with two drums, exchanged against each other by a simple manipulation. The useful width of the paper tape in this case is about 80 millimeters ! o, somewhat less than in connection with the former type This is why the one is generally used for accurate, scientific investigations and the latter for ordinary clinical apparatus

#### Tressure Hunting.

The United States Hydrographic Bureau and Coast Survey has charts of the Great Lakes and the Atlan fic and Pacific, coasts which are consulted eagerly by

not so generally prised by the lest. On the Great Lakes alone one of wrecks are chi tain many millions of dollars in b and ore. There is no vague uncorand one. I never he no vague ancertainty about these treasures. They were known to exist in the holds of the ships, and no man has yet been able to recover them. The steamer "Pewable," for instance, which went down in Lake Huron in a storm in went down in lake flured in a morin in 1865 carried with her half a million del-lars worth of copper from the Lake Super-lor mines. For three decades expeditions sought to find the wreck, and finally it was

located about six miles southeast of Thunder Bay. But the wreck was in such deep water that only a rut the wreck was in such deep water that only a very small fraction of her carge was ever recovered Here is a submarino copper mine which might tempt the most adventurous soul to risk his life in gaining. The chart of wrecks on the Great Lakes compiled

ly the Hydrographic Bureau and Coast Survey shows the relative depth of water and this simp tels the whole story of why enterprising man has not been able to recover them Divers seeking treasures in sunken vessels have learned that anything which lies much more than 100 feet deep is very difficult, if not absolutely impossible to recover The pressure of the water beyond that depth becomes so great that diving suits are apt to collapse and crush the wearer We know from a study of the charts that bundreds

of ships leaded with tressures have sunk in wa ter ranging from 100 to 250 feet in depth and if div ing suits could be stand the ener mous water presest depth and enable the diver to work easily, enormous fortunes could be quickly made The whole his-

hunting under the water has been marked by man's futile of-fort to fight against the pres-sure at great depths. One hundred feet the surfa the see, the presdivine inflated

#### BOUGH-MIXING APPARATUS

Pictured in the acc vice adapted more particularly for kneeding dough, but which is also applicable for mixing, stirring, or charaing any material for household or culinary

DOUGH-MINING APPARATUS.

purposes. The machine comprises an approximately rectangular reseputate A formed, however, with a curred bottom, and an outer casing B, which acts as a support for the receptacle I from the will be defined as a support for the receptacle I'm end walls of this mixing machine are provided with journal bearings, in one of which a crank handle of its supported bearings, in one of which a crank handle and the survive one end of a spirally curved altirer binde if The opposite end of the stirrer binde is formed with a threaded him into which as extension of the crank handle and it sorrewed discovered providing area or curred fingers. It the object of which is to extend the material that is not properly altred and mixed by the main sitter binds. In use as the crank handle is turned, the fingers tend to feed the material toward the content, so that it is fully acted upon by the mass. turned, the fingers tend to feed the material loward the center, so that it is fully attend upon by the main blade. We are informed that in practice this type of silver kneeds and mixed the dought theredgathy and evenly in a comparatively abort time. By holding the stirrer blade and turning the crank in a revener di-rection, the latter will be unserwerd from the hub-st of the control of the silver blade may be re-moved from the recollecte. A pattern on this mixtus mechanism has been granted to left danier E. Ray of McClonnellaburg, Pa.

### IMPROVED STEP LABOUR.

INFROVED STEP 1.505ER.

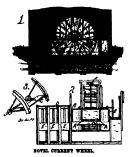

In the SCHETTIVE AMERICAN ON November 14th, 1908, we published a description of a collapsible step lack of the step of the ste The ladder is collapsed by swinging one side against the other, but normally the rails are held apart by means of a diagonal brace, such as shown on the lower section of the ladder. The steps U of the ladder are hinged to one of the side-rails as shown in Fig. 2, while at the opposite side they are provided

#### Schotific American

with brackets D, in which are alots edapted to engage hinge prins secured in the side-rails A. This side and pin connection provides the necessary play when the ladder is collapsed. The pins on which the steps are hinged its at right angles to the rails A, and in order that the tread surface, may be horizontal. the steps are made of a substantially wedge shape, as indicated in the illustrations. The top or platform ### of the ladder is also hinged to the rails at the F of the ladder is also kinged to the ralls at the points FP, which ilso on an arise at right angles to the rails B TO support the ladder in its normal technical position, two lags G are provided The lags are connected by the usual links B to the rails A and at the supper mids they have accession pieces that shortes the index, those extension pieces with the shortes the index, those extension pieces with the upper rails B are withdrawn from their sockets. Then a top piece, such as indicated in Fig 2, is applied to the ladder, the four short legs of this problem is inserted in the slewes at the upper reside of the rails A. The language of the control of t and also through the legs of use top piece. In pre-vent the legs of from apreading too far they are re-tained by means of brace bars K. The links H in this case are unnecessary and are folded upon the serves, as indicated in Fig. 2. Mr William J. Birm-dell Box 182, Brooklyn, N. Y. is the inventor of this improved step ladder

A number of advantages are claimed for the wheel illustrated herewith namely that it does not require the use of dans, it regulates itself to the rise and fall of the stream, uses only the surface curre is equipped with feathering blades, and is provided with means for preventing the parts from freezing fast in cold weather. The water wheel is supported on pontoons, as indicated at A in the illustration.

The pontones are connected by means of links or parallel arms M to a fixed framework supported on parallel arms M to a fixed framework supported on the construction of the blades used on the wheel The spokes of the wheel arms parallel spokes of the wheel arms interested at their outer ends. The blades O are hissed to rods connecting the parallel spokes of any hissed to rods connecting the parallel spokes and have free play in the bifurcated portions have provided as very strong construction, and enables the that there is no litting of the water as in an ordinary blades to accommodate themselves to the current so that there is no lifting of the water as in an ordinary water wheel. It will be orident that as the water rices and fails, the wheel will rice and fail with it so that the blades will always extend to a uniform depth into the water However when the water rises the surface current is spit to be very swift, and it is necessary to reduce the flow past the wheel. This is effected as follows. On the up-stream side of the structure a wing D (Fig. 2) is built out diagonally structure a wing is (Fig. 2) is built out diagonally into the stream, so as to direct a large portion of the current between the pontoons and against the water wheel. In this wing are a number of flood gates N connected by means of ropes and pulleys to one of the pontoons A in such a way that as the water rises, the content of the pontoons A in such a way that as the water rises, the positions A in such a way that as the water ries, the gains will one, permitting the water from through them, and thus cutting down the current that strikes the wheel To protect the parts in cold weather, a casing is built over the wheel, at the top of which is a suction fan P This is belied to the wheel as shown in Fig 3 Through a dust of a current or warm air is conducted to the linetier of the casing, and thence is succled out of the top of the casing was the conducted to the linetier of the casing the means of the fine and delivered them, and proved the case of the ca

through the duot G The inventor of this improved water wheel is Mr W P Spooner, Box 3 "The Manse," Carlevale, Saskatchewan, Canada.

CAL-RYALBIES DEVICE FOR RAILWAY SURVEA.

In order to insure the safety of cars when rounding curves, and to prevent the car wheel flanges from
having under frictional engagement with the rails,
a safety mechanism has recently been invented, which pictured in the accompanying engraving It con sists of a central rail A, that is supported on the

METROD OF RETAINING CARS AT CURVES.

and is strongly braced by means of anchoring de vices B, which are imbedded in the ground and term-inate in plates C. The object of these plates is to prevent the anchoring devices from working upward. prevent the anchoring devices from working upwara.
The illustration shows a portion of a car truck passing over the rail A. The axies of the truck are connected by means of suxiliary trusses B, below the method by means of addition, these D. serve the main trusses, on which blocks A are supported De-signed to travel around these blocks B are endices chains P fitted with rollers The rollers are present by the blocks B against the guide rail A. As the truck passes round a curve the rollers tend to keep it in place. Ordinarily the forward wheel on the outside of the curve tends to bear against the rail, owing to the fact that it is rigidly connected with its mate on the other side of the curre, and beares it cannot travel faster than the latter. The result is that fange on the outer wheel is subjected to considerable may are the centering device here shown, however will present the fange of the outer wheel from being in duly pressed against the rails. The guide rail serves to present agreeding of the rails, and heeps the cars from leaving the track. The inventor is Robert Bel-dess of theirs, dispersions. owing to the fact that it is rigidly converted with its den. of Pulga. Cal

### MASSAGE APPARATUS.

A patent has recently been granted upon a device for securing a vibrator to the hand for application in the operation of massage. The apparatus may be adjustable to adapt it for use by different persons and adjustable to adaly it for use by different persons and may be severy (chapped to the hand, so as to impart to if the vibratory movement that is used in certain massage retailments. As shown more particularly in Fig. 2 which is a cross section of the device with the vibrator removed it comprises a padded unbino A provided with two plates B and C which terminate in horns E and F that fit the palm of the hand These horns may be covered with sleeves K of rubber if desired The plate C is formed with two lugs, between which is mounted a screw of and the latter is provided with a knurled thumbplece, whereby it may be

TABLET ATPARAGE

### Scientific American

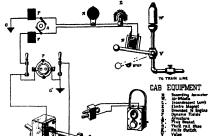

turned The plate B is fitted with a nut H that on gages the screw, and as the screw is turned the plates are relatively adjusted to bring the horns closer or are relatively adjusted to bring the horns closer or move them farther apart in this way the device may be clamped on the hand. The cushlen A, how-wer, renders the device combratels to the operator Projecting from the forward end of the device is a bracket. As a indicated in Fig. 3.1 to which the vibrator mechanism is applied Fig. 1 shows the preferred form of vibrator, which has a threaded storn that congame a in the bracket / A locknut / serves to make sochet in the bracket J. A lockmut J serves to make the vitractor is assessment of the vitractor is assessment occupied with a hundle sat indicated by deticed lines to that it may be used without attacking it to the hand in such a case however various "applicators" are secured to the threshed stem to take the place of the operators hand Fig. 3 shows another form of the contract o

STREET INDICATOR FOR CARS.
The desirability of having the streets abnounced by means of a conspicuous sign in a street car has often been urged but hitherto efforts in this direction have been urged but hitherto efforts in this direction have met with little success Quite recently when a device of this type was about to be adopted on an importan-city line the objection was raised that it would ob-struct and detract from advertisements placed in the This objection is overcome in the apparatus shown in the accompanying engravings, which not shown in the accompanying engravings, which not only announces the atreets but also displays adver-tisements at the same time. The inventor hopes that itsements at the same time. The inventor nopes that by making the device self-paying as well as a convenience to the public, it will meet with better favor than street indications heretofron devised. The prominence of an advertisement placed where all eyes would be concentrated upon it should make this a most valuable advertising medium. It is the in most valuable advertising medium. It is the in ventors idea to use a succession of advertisements so that the display could be changed at out a street with the street number. The sign display and street ator is arranged to be hung at any suitable point

The railroads have long recognized the fact that what is needed is not a machine to take the place of the outginer, but one which will sat as a check upon the engineer without taking the responsibility from his shoulder—a system that will perform the engineers work in case of any longe on but cars.

lapse on his part this lapse so that the responsibility for fail ure on the part of the engineer will be de-terted A system of this sort was recent ly installed for pur poses of experiment over a short stretch of the Eric Railroad from Newark to South Pater son. The system is quite ingenious in the tion against broken rails as well as colli sion, and furthermore is provided with tele enables the engineer to communicate with sta tion houses along the line when the train is brought to a stop for any reason and even while the train is run ning at full speed. The advantages of this tele

anyantages of this tele
phone system will be appreciated by passengers who
can use it to communicate with their homes or to
conduct business while or route and the train dis
patcher is enabled to rous into direct touch with the various units along the line which units along the line which are under his in this system the track is divided into block sections, and the train as it enters each block else trically tests the block shead to determine whether

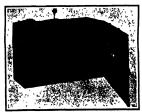

metal frame of the locomotive.

metal frame of the locomotive. Enough the statement of the cutto interrupted the magnet R would be discussed, permitting the valve F to open, thus putting on the brakes and blowing the whistle W with abortom the train line At the same time the lamp L

Fig 1 -- DIAGRAM OF ELECTRICAL APPARATUS AND CONFECTIONS OF THE CAR OF THE LOCOMOTIVE

would be extinguished and the ammeter would record would be extinguished and the ammeter would record the time when the interruption or urred. The field circuit is grounded in the locomotive at G and O'; Setween the fields and the pround O' is a kind switch A mounted on a third rail show S At the side of each block extending for a distance say of fifty feel in a rail T (Fig. 2). When the show F suggester this rail is the side of the side of the side of the side of the circuit of the fields through the locomotity. However, circuit of the fields through the locomotive. However, the circuit of the fields would not open unless there should happen to be a broken rail or a train in the

Alongside the track are two lines, U and D, one of which is connected at intervals with the rails of the track while the other is connected with the third rail sections T These lines C and D run to a station house where the circuit is completed through a switch house where the tireuit is completed through a switch that may be opened by the engineer in charge of the house whenever he desires to stop the trains along the system under his control. The line  $\mathcal O$  contains a switch a for each block section, which is held in closed position against the tension of a spring by means of an electro-magnet  $R^*$ . The latter is connected in series electro-magnet  $R^1$ . The latter is connected in sortes with the rails of the track and is energized by a bat tery B at the opposite end of the block system. In case of a breakage in one of the rails, or should a switch be thrown open, the magnet R' would be de-energized. permitting the switch a to open and thereby break the field circuit of the dynamo on the approaching the field circuit of the dynamo on the approaching trials with the consequent setting of the brakes as described above. The same result would follow if the circuit through the magnet k should be short-circuited by a train on the block. At P. (Fig. 1) is a plug socked adapted to revelve the telephone plug coanse-tion. The telephone circuit is completed past the well-clear at through a coil R. This resistance permits switches a through a coll N - this resistance permits the passage of the alternating current of the magneto and telephone, but prevents the passage of the direct current to the dynamo so that telephonic communication is not interrupted by the block system.

STREET INDICATOR FOR CARS.

in the car and immediately after passing a street the mechanism is actuated to announce the next street and display a fresh advertisement. This change is effected by means of contact plates which are secured effected by means of contact parces which are secured to the cross where supporting the trolloy wire. The contact plate ongages a spoke of a wheel, causing the latter to make a quarter turn and momentarily close an electric circuit coming from the wire that supplies current to light the car. This momentary impulse sciustes a relay in the apparatus contained within came of the indicator, and by means of a small electric motor the webs on which the street numbers and signs are printed are turned to the required degree signs are printed are turned to the required degree Should one of the plates become deached from the cross wire the conductor can operate the indirector yu usans of a switch. When the end of the line is reached the michanism is reversed so that the street will be announced consecutively in the reverse direc-tion Bhould the air cross a different set of streets on the return trip, instead of rausing the web forward on the return irly, instead of running the web forward for the whole round and then rewinding at the start-ing point the web may be arranged to bear the streets of the return trip interspersed with the streets of the forward trip and a shutter may be employed to cover the street names of the first part of the trip, exposing only those of the return trip. The inventor of this ctreet indicator is Mr. H. Alwies, 214 South 11th

#### AN AUTOMATIC RAILWAY SAFETY SYSTEM.

It is a comparatively simple matter to develop an absolutely automatic ruliroad system in which the engineer will be entirely dispensed with and the trains will run under electrical control from some central controlling station. The reason this has not been done so far, however is because no entirely automatic engine ig as safe as one controlled by an engineer

there is any obstruction on the rails or whether the

talls are broken The accompanying disgrams illustrate the equip-

The accompanying diagrams illustrate the equip-ment used On the locomotive there is a shut wound dyname driven by a small steam turbine which is supplied with steam from the boller in series with the armuture 4 of this dyname is an incandescent the armature 1 of this dynamo is an incanoscent lamp L a recording sinusetr R, and an electro-magnet E which serves normally to hold the arm of valve 1 on the afrbrake pipe of the train The fields F of the dynamo have their circuit completed through the

(Continued from page 227) must also be accepted with a slight allow ance for exaggeration

In recent years deep-water salvage of treasure ships has excited the cupidity of divers adventurers, and business men There is altogether too much wealth lost under the water to suit us. Here is what an expert diver and wrecker has to my

Within fifty miles of Sandy Hook there is wealth enough sunk in the ocean sand to stock the United States Treas ury All the private treasure ever buried in the earth would be a triffe by the side of it. The bottoms of both the Atlantic, and Pacific Oceans are vast treasure beds. The man who can devise a means of The man who can devise a means or traversing the ocean bottom might rival Rockefeller A vast amount of treasure is as accurately located as the banks of Wall Street. Any experienced diver can take you to a chart and lay his fingers on any one of twenty spots and say Go to longitude so-and-so in a latitude defin able within fifty feet, dive deep and bring up a fortune (mly you can't dive deep enough A great deal of this treasure is the deposit of recent years. Still more went down before the days of occan thers At one time specie was trans-ported in men-of war Gold dust and dia monds were shipped from mines on rickety schooners for want of better

in twelty years there were mearly five thousand wereks on the Great Lakes. Of these over one-fifth or approximately one thousand, were total hosses. The total measurement of the continuous of in twenty years there were nearly five covered The steamer "William Home," which sunk in 1895 off Swishwah Point, which sunh in 1895 off Swishwah Point, Lake Michigan, carried to the bottom \$230,000 worth of steel billets, and the steamer "Clarino" loat in 1816 between Cleveland and Detroit, carried a deck index of new locomodives to the bottom. Iron and coal cargoes have been distributed freely over the bottom of the Great Lakes and some day the miners of these core equipped with improved diving dress, may recover goodstood fortunes from the bottom of the lakes.

scene of treasure hunting, and it is com monly spoken of in the lumber camps as 'The lake of Sunken Treasures' The reason for this is that back in the early reason for this is that back in the early lumbering days large aums of money were shipped to the numerous lumber camps in small vessels, and literally dos ens of these were lost. All of this money lies somewhere at the bottom of the lake for the treasure hunter to find

Among the many important wrecks of

Among the many important wrocks of treasure ships which are partially or exactly located on the charts of the gov ernment, mention should be made of the Pacifix Mall stoamship 'Golden Gate,' sunk neur Manzanilla, Mexico with \$800,000 in gold coin and buillon and the Klondike steamer 'slander,' sunk or Douglas Island, Alexka with \$750,000 in gold dust. The greatest prize of all sunken treasures.—if all is true which arrying to the bottom of Cumana Bay. tral American" went down of Havana with a similar amount in gold. The steamship "Lexington" which went down in Long Island Sound was reported to have contained \$300 000 in specie

The record of these number treas (Concluded on page 229)

## Cadillac once more proves itself most economical car

Remarkable record submitted by 75 Cadillac "Thirty" owners in New York metropolitan district who have driven their cars 398,884 miles at a total cost for mechanical repairs of \$53,21, averaging 71 cents per car.

travel and transpose can be or person-country. There was in this instance no special striving to attain a manimum. The 75 owners went their separate ways with their 75 Cadillae "Thirty" care, each wilhout reference to the other.

The 73 owners warry with the 73 Cacline or They way with the 73 Cacline or the other warry was a second presented to be other.

ships along our two coasts and Great Lakes could be extended indefinitely Lakes could be extanded indefinitely Some of the treasure has been recovered such as the boxes of gold lost in the Bpanish steambhip feterodes sunk man the Canary Islands, but in most cases very little if any of the money has were been brought up by divers There have been strunuous efforts made to salvane these tween weath and the salvane these tween weath and the salvane these tween weath and the salvane these tween weath and the

to salvage these known wreeks and in ventors have been busy for half a cen-tury devising means of getting at the tury devising means of getting at the wealth lost under the water. The all minimal diving suit that resembles an infinity of the suit of t of this armored diving dress was so grea-that ball bearings of harder material than aluminium were found necessary. The aluminium auth protects the diver from the water pressure and at great depths water pressure and at great depths that a the water pressure and at great dopths the armor is so light in wright that a man can walk around easily with it on man can wank around easily with it on in addition to the articulated armor suit the diver is provided with an in ricate system of hooks operated by the hands from the inside so that his work can from the inside so that his work car be perform I without exposing any part of the body. The divor is provided ith a felephone a headlight and an appar-atus which registers the amount of air atus which registers the amount of air sent down tirough the breathing t be The wreciers from above can thus tell at all times the condition of the div r

The science of salvage as conducted by modern wrecking companies in the ra moorn weeking companies in the rais ing of ships in a matter totally outside of that of raising suchain treasures. The control of the raise them to the raise them for the most part been in the water so long that to raise them by compressed alr would be impossible. Teler rotten decks and timbers would explode and burst assunder long before soldient air could be pumped into them traise it em from their modify beds Consequently the savings of treasure-laden ships of the part is purply a matter of deep-sea diving. The diver who was go down it december the work of the venture and the part of ing of ships is a matter totally o staids

ing device the man who descends to great depths must encounter other perils of a blood curdling nature Rotting decks and timbers may set a trap for him through which be may fall to his death Long tunnels through deserted cabins and hulls filled with floating objects may and nulls hird with notating objects may tangle up his tube through which fresh air reaches him and within a space of a few minutes death by suffocation fol-lows. There are grisly welves of the ocean to encounter in some seas veritable ocean to encounter in some seas veritable man eating sharks and other death-deating monsters of the deep A single raise step may precipitate death and yet time is precious and speed of action must be attained Dark ionesome hulls must be examined intricate cabine broken into and not infrequently the golden treasures. and not infrequently the golden treasures must be dag out of the sand and mid into which they have buried themselves and one that it is a grewsome sepreince and one that keeps the trongered which can extend the interior of a sunker skip whose ribe have been rotting be mach the occas a waves for a century or more. Some timbers are so well preserved that they rannot be broken easily with an ax and others so decayed that are sandy as a further source of the control of t a every can tarter a nam through theses.

The diver earns all the wealth that he gots from a sunken treasure ship and only the hardest and must expert divers will undertake this work. They prefer as a rule to stick to ordinary wre in water forty to fifty feet deep.

## The Car That Captured The Country

The Overland—as some of you know—s the greatest sensation in motordom in two years the densed has grown from almost nothing to 20 000 cars—our orders for the present year. All without adversaing—solely because there was never a car that compared with the Overland

## The iron on your anvil tells the story of the coal on your forge

PERHAPS you haven't realized how much quick work and a good job depend on the quality of coal you use. But you do appreciate a

depend on the quanty of good, hot, steady fire.

Blacksmiths who have looked into the question and experimented have found that a high-grade coal especially adapted for smithing purposes is a wonderful saver of time, and remarkably increases the quality of work. They have found that

## **Webster Smithing**

is distinctly superior to ordinary smithing coal for forge use because:

It is practically free from sulphur, fuses iron or steel quickly and insures a firm weld. Welding is impossible with sulphurous coal.

It is free from dirt or slate. In other words, WEBSTER SMITHING COAL is pure coal, high in heat-producing efficiency. It ignites quickly and burns long with an intense, steady heat.

WEBSTER SMITHING COAL has given such good results that big shops all over the country are using it exclusively. These are the shops that turn out a maximum amount of work, and are winning reputations for quality and thoroughness.

WEBSTER SMITHING COAL is mined from one basin in Cambria County, Pennsylvania, and runs wholly uniform It is sold by Ioo al dealers all over the country. Nours can supply it If he won't, write us, and we'll quote you prices for direct shipment in carload lots. Let us hear from you

#### A TRIUMPH OF MODERN STEAM ENGINEERING

MOM the many brilliant sucreases of the scale of the scale which have been obtained at the Fifty ninth have been obtained at the Fifty ninth heavy service of the New York Subway libri by the heavy service of the New York Subway libri by the low pressure sylinder rahmant and the nonleaser not only has the nouted of the present reciprosating an only has the nouted of the present reciprosating as a increase of nearly 150 per cut in the recommite capacity of the whole plant

In a recent issue of the SLIVILIK AUPRILA WERE AND AUPRILA WERE AND AUPRILA WERE AUPRILA WAS AUPRILA WERE AUPRILA WAS AUPRILA

During 1908 it became apparent that the rapidly increasing triffic in the bibbway would render it necessary to provide additional power for the sinter of 1909 1910. The main power plant consisted of after 1500 1910 2011, and the continue and the ratio power plant consisted of after 1500 1910 2011, training units of lighting and signal purposes. Of these engines and there ratio units the authors of the pair ray. 'In general they are the most satisfactory large units ever bulk, as the years' experience with them has proved.'

In considering the problem of securing an additional supply of power electric transmission of power from a hydraulic plant was rejected because of the high cost of a double transmission line from the near est available water power and the impossibility of getting reliable service.

The gas engine, it will surprise many of our readers to learn while offering the highest thermodynamic efficiery would have cost at least 75 per cent more than an ordinary steam turbine plant and its main tenance and operation account would have been from

cenance and operation account would naview from four to ten itimes great; The alternative of building more re-iprocating englies of the tipe already installed was rejected (in spite of their mest satisfactory prformant; ) because of the high first cost and the small range of (conomical operation the tween 7 300 and 8 700 kilowattes). The water rate relaing very rapidity beyond these limits

The wait rate ening very rapion's occord to be interested as a beaver in the Installation of the by excellent and a beaver in the latest of the latest and the latest and the latest and latest a latest as a low pressure turbine with the present engine at least 8 per c. on higher efficiency sould be seened than with a high pressure turbine unit alone, and it was finally decided to place an order for one 7.00 kilowat! (maximum rating) turbine unit aluee by this mans "the companie would not only get an increase of 100 per cent in capacity of the combine engine and turbine." but at the same time after the engine and turbine." but at the same time after the engine and turbine. "Int at the same time after the engine as the latest and the latest the conditions as well as the latest and the latest and the latest and the latest the engine and turbine." but at the same time after the order to get firsts using the latest and the lates

The net results obtained with this first installs tion are summaried as follows. An intrease of 100 per cent in maximum causatily of plant, an increase of 148 per cent in economical capacity of plant, a saving of approximately 85 per cent of the condensed steam for return to the boilers, as average improvement in seconomy of 15 per cent of

the best high pressure turbine results, an average inprovement in economy of 25 per cent (between the limits of 7,000 kilowatts and 15,000 kilowatts) over the results obtained by the engine units abore, and lastly, an average unit thermal efficiency between the limits of 6,500 kilowatts and 15,700 kilowatts of 20.6 per cent

These results are surely entitled to be considered as constituting the lov pressure turbine one of the greatest triumphs of modern steam engineering

EY WEST, by AW AMERICAN GINRALTAR Y WEST, by virtue of its geographical posi-tion stands in the same strategic relation to the Gulf of Mexico and the Caribbean Sea as does Gibraltar to the Mediterranean, and its naval and military importance, which have always been recognized have been greatly increased by the results of the late Spanish war and the construction by the United States government of the Panama Canal The transformation of Key West into a great navel and military station which shall rival in importance the fortrees of Gibraliar is advocated at considerable length in an article by Commodore W H Beehler U S N, Commandant of the Seventh Naval Destrict Which appears in the March number of the Journal of the Military Service Institution The first part of the Commodore's paper is devoted to an urgent plea for the more complete co-operation of army and navy forces. The army and navy should be as intimately connected as are the navy and the marine corps, and this connection should include, as far as possible both the personnel and material. Guns and ammunition should be of the same general type. with the latter interchangeable and supplies and stores should all be of one standard. It is admitted that close relations between the army and navy would be subject to certain limitations, but the Commodore s that it is essential that the coast artillery co and the navy should be intimately associated for the officient defense of our seaboard. There should be a definitely assigned portion of the navy to act as Navycommery assigned portion or the may be at an early Coast-Defenders, and in this class should be included second class battleships or older battleships, the smaller torpedo beats scouts, submarines, mine-lay-ing vessels and tugs. "Their cooperation in the de-Coast-Defende fense of any particular naval base should be definitely arranged in time of peace and they should maneuver and drill now, under the command of a designated officer of the coast defense service, whether he be an army or a naval officer'

In his proposal to make of Key West an impregnable Olbraliar, it is pointed out that the present defenses at Fort Taylor are imadequate for the reason that lattic-ship can like at the currance buoy seven niles south of Fort Taylor, beyond the range of the 21 inch riffs mortan, and destroy Key West from that point without being exposed to any danaer the remaining velocities of projectites from the direct firing 10-inch and 12 link gons being insufficient to penrate the armor of any latticably, whereas these same cellber guns on a hatticable could shell the city of Key West and completely destroy it.

This consideration brings the Commodore to his novel proposal for rendering key West impregnable the points out that in place of high hills or a luge rock as at fibraliar, for the mounting of coast of fonse guns Key West Harbor, twenty five miles in length red on the north by a line of low reefs shoals which form a complete protection on that side, while seven miles to the south of this line there is a parallel line of eastern shoals, some of which are scracely awash at low tide and none more than eight To build forts on these outer feet above high water reefs would be so costly that it could scarcely be con-sidered, but Commodore Bechler proposes to take our monitors and older battleships which have pa them in selected positions upon these reefs, and utilise them as permanent turret forts. Thus, for instance, selecting the shoal known as Rock Key where there is a small natural harbor, he would lighten the o monitor "Amphitrite" by the removal of her propelling engines, haul her into the harbor, build are the the vessel a dyke of piling, rock, and riprap, and then fill in the space between the inner face of the dyke and the ship with material hydraulically dredged and deposited. He estimates that the work would not cost more than \$50,000, and he claims that the seacoast defenses would thus be increased by a doublecoast onemose would rung be increased by accurate the unrested fort containing four 10-inch breech-loading rifies and provided with admirable protection. The visials of the fort, that is the ammunition rooms, turret turning gear etc. would be pretected not only by the armor of the ship but also by many feet of the in losing earth and riprap. The deck of the monitor would be about eight feet above mean low water, and the riprap would be carried up the sloping face and over on board, leaving only the turrets and super

atructure exposed

The ship as thus imbedded would furnish, says the
Commodors, a complete, modern double-turreted fort,

ary feature to operate the p with every nec with quarters for the officers and mon of the garri-son, and moreover, the entire cost of the installation would be less than the cost of mailitaining such a shipin the navy for one year 'The monitors "Mantonomah," "Terror," and 'Puritan' could be installed upon the adjacent reefs, and the range of the sixteen 10-inch and 12 inch guns of these forts would com-mand a large part of the Straits of Florids, and especially that part which is used by westbound ve entering the Gulf of Mexico which navigate close to he Florida reefs to avoid the strong current of the Gulf Stream Incidentally it may be mentioned that the dyke would be extended in each case to form a small harbor of refuge for torpedo boats and sub Referring to the proposed island fortifications for the defense of the entrances of the Chesapeake it is suggested that it would be a great economy it one of our old battleships such as the "Oregon" were used as a central point about which the island could omy if be built

where it is a question of great interest and of uncertainties moment, whether this every noval preposal of the Commodore does not provide an opportunity to greatly lengthen the useful life of the batteship in view of their enormous and rapidly growing first cent the rapidly with which these instruments of war depreciate in military value is consenting aspaining in a few years after their commendation of the property of the property of the property of the commodors of their contents of the property of the

#### PAULEAN'S FLIGHT NEAR NEW YORK

VALTOR LOUIS PATULIAN succeeded last week in getting the bond which he is required to put up in case he files reduced to \$8,000 for one week, and on Friday, March 11th, he made two exhibition flights at the race made and the reduced to the result of the reduced to the result of the reduced to the reduced spectators as it was thought into M Fusilian would attend to the with his werltal radder tiled or There was an is to 10mile brees blowing, and by starting against the wind Paulhan left the ground after a run of about 76 teet. He rose rapidly, and in the course of the two circuits of the track, made in the course of the two circuits of the track, made in the course of the two circuits of the track, made in wind Despite the sharp turns the machine did not five very much in making them It appeared to rock and just in slightly, but was always under parfect control. The descent was made rapidly and at an angle of the light of the property of the track the reduced was made rapidly and at an angle of the light of the property of the reduced was made and the none circuits in 2 minutes and 38 seconds.

### REQUIREMENTS FOR THE SCIENTIFIC AMERICAN

His little annual competition for the handsome trophy given in 1897 to the Aero Club of America by the publishers of the Eccative America. As in new one to all artisters. As aviation has at last reached a stage where crosscontary fights of a considerable distance are being made, it has been decided to sward the trophy for 1816 to the valutor who makes the longert cross-country flight in cross of 10 miles, which has been fixed as the minimum distance. A round trip flight of 35 miles each way will also fulfill the conditions. The flight may be made at any point in the United States that is convenient for the strator, who must notify the Aero Club of America or the Britzerium Austura as a sufficient time in advance to allow of the sward of a repersionative of the club to officially someting of a repersionative of the club to officially observe it. The observations of the complete for the trophy whenever compation miles.

The dates of the international balloon and servipilno races for the Bennett trophies have been fixed by the Aero Cibb of America. The balloon roos will be held at BL Louis on October 17th, and the screptime rare above the Hempstand, L. I. plains (probably) on Crober 28th All Plans are also on foot to held big wrintion meets at San gatonio, Texas, in April, et &besisted City, N. J. D. July, and a St. Louis in Quick.

ha a resent communication to Fight on the relative military value of acceptance and airship, 6.0 Capper of the British army believes that the improved servplane will have the dirighte at its mercy. He predicts that the future acropiane will be able to accend to heights of 10,000 feet and over, from which it will swoop down and destroy the more slowly moving dirichine heights.

The New Mayes Railroad has proposed to the tity of boston to state into the joint construction of a tupnel between the borth and South stations in that city They offer to speed \$18,000.000 on the control to the tunnel which is to be electrically operated, provided the city will bear the expense of \$10,000,000, which it is settimated will be the cest of the purchase of the necessary land.

One of the most remarkable features of the New York Public Library, now slowly nearing completion, will be the lunge stank room, bo feet wide, also fact long and 80 feet in height, containing seven tiers of stacks. The metal work of the stacks alone weight about 3,000 tons, and revently, in estimating for the publishing contract it was fround that uper-ly to pass once through the multitudinous nests of stacks it would be necessary to cores seven miles of distance:

The last annual report on the shooting in the birt is har wy show that the percentage of this to rounds fixed during 1900 was 6407. In 1905, it was 2007, in 1906, 1460, in 1907 1543, and in 1906, 545, 075 to significants of these figures will be evident when it is stated that in 1907 the site of the target was greatly reduced, the number of bits in that year being consently only sithethy greater than in the year prequently only sithethy greater than in the year pre-

placing of a large order by the Admirally for liquid in a last of the cangerwise statements in the liquid in the lost of cangerwise statements in the contemplates the practically extinct to the of ull fuel There is no truth whatever in this statement. A rebundered tone of ull will be started in future battleablys as an auxiliary to eval and oil will continue to be used as foul in certain tunesee of torpedo busts Graut Urtilain possesses no such extensive oil fields as would warrant as drastic change of this character.

A passeal scheme for constructing a north break water to the entrance of the Pananau Canni has water to the entrance of the Pananau Canni has papproved, and the preparatory work is being done paperoved, and the preparatory work is being done at Culon, and will sheller vessels which are making that at Culon, and will sheller vessels which are making the north-carrier within prevail from Culore to January There will be two jettles of rock, which will call the prevail from Toro and Manasatillo points until they reach deeths of water of 48 and 44 for, respectively

Some hydridicions statements were made recently Representative Rainey about the new 1 (in hir coast defense gun, which is undergoing test at Sandy Hook, in the course of which he spoke of the gun as having 'burst' on trial. As a matter of fact, the gun has shown excellent results, and given much satisfaction to the army men. The serident, which was a trivial one, consisted in the breaking of a part of the mechanism of the disappearing carriage, whith deaped the test only a few days, and was quickly under the property of the property of

It is now officially stated by the Pennsylvania Raliroud Company that the four tubes under the Rali-Rilver and the electric service as far as Januace will be pinced in operation on May 15th. The trains will run, under a five-minute headway, from the new terminal at Thity-bried firect to Januace without a stop, in 18 minutes. The main yard, station, and office-000 will he expanded for this purpose. The tunnels to New Jersey will be in operation by July 1st, and the lines along the north shore to Great Neck carly in January, 1911.

January, 1911. Exploses the Mark A. C. Swinton described, a special stansproposited surcolause built by Explose of turbine fame, which made successful slightly in 1898, thus antestating the Langles in classes, which problem of diameter, mispilled steam to a cylinder 134, by 2 inches in classes, which weight of engine, propoller, and water being 134, pounds. The servojame consisted of two vings and a tail built of a silicovered, cane framework, the whole apparatus with engine weighing 35, pounds. The model made several fighting 35, pounds. The model made several fight of about 100 yards distance, coming down when the steam pressure was exhausted. The bodier, which carried 50 pounds, was heated by a spirit lamp.

#### ELECTRICITY

In an article in La Revue Meetrique, on the effect of high temperature on insulating materials used in dynamo-electric machiners; it was pointed out that cotton does not show any injury when exposed to temperatures below 105 day C, but that at 115 day C It begins to deteriorate and above 125 degrees it rapidly distinguishes.

The reputation for efficiency of the New York tolephone service has a great all over the world. In Paris the service has been so peor of late that the subscriber have organized to demand improvements. Quite recently the Ministère de Postre et des Tri. graphes of Panne applied to the vier-presiden, of the New York Telephone Company, asking if he would be villing to train at telephone officials from paris in the various methods employed in New York. The connect was called accelerate.

The state of the s

A recont number of the Filestric Italiaway Journal describes briefly a peculiar electric locumotive used for canal havings near livemen. The locumotive runs on a quay, which has to be kept clear for the passage of drays. In order to secure the requisite weight for adhesion, the lomounture is built in the form of two inverted Us connected at the top with a girder. The which of each lines in only 3 that here and so the drawing motor had to be placed in the upper part of the and can travel up and down the quay without the turbing the trucks, which pass between the Us and under the connecting girder.

A special type of motor has been built for a British proder factor; in which pres autons have been taken to render the motor flame-proof and explosion proof. The motor case is very strongly built, so that it will stand explosion of dust or gases which might find thair way into it. The Joints of the motor case are packed with hence rose disposed in fact this being concern to the proof of the motor case are packed with the proof of the motor to the work of the proof of the motor. The beautina are asked specially scaked to prevent the creape of hot gas in case of explosion within motor. No ventilation for the interior of the motor is provided, but the casing is formed with corrugations with furnish a large cooling surface.

In the discussion which followed the reading of a paper on underground conduit construction for large transmission systems before the American Institute of Kiestrical Ampiners in this age to tendos ting litus ration, was given to posit out the advantages of concerts over the beause of its lower thermal conductivity and its better host resistance. A hurrout control of the beause of its lower thermal conductivity and its better host resistance. A hurrout intity and its better host resistance. A hurrout intity of the control of

The naval gun factory at Washington, D. On March 6th Vesuvius suddenly became active again There was a continuous cruption for twenty four hours of red bot stones and ashes, accumpanied by internal detonations Several fissures opened, from which gas and laws emerged in great quantities

Prof. Wilhalm Trabert has been appointed director of the Central Institute for Motorology and Geodynam ice at Vienna, succeeding the late Prof Josef Maria Pernter As director of this institution he is the official head of meteorology in Austria

Dr. Falix Exact of Vienna has completed the great treatise on meteorological optics begun by the late Prof J M Perater in 1802, about two-thrids of which had been published up to the time of Peraters death in 1808. It is the only extensive modern work on this subject

The commission appointed to examine the Leaning Town of Plan has provide that It thinks its found tions may need attempth along A spring relies under the tower, the water of which is raised by steam pumps for the use of a local factory A at he bed of the spring is empited, it is feared, a subsidence of the ground on which the campanile stands will follow

Dr. Herman O. Bunpus, director of the American Massoum of Natural Bistory announces that up to leak August, at least, V. Siefmanns and R. M. Anderson, August, at least, V. Siefmanns and R. M. Anderson, from Mr. Riefmannoun, from Herschelt Island. In the Artic Grean dated August. 19th 1900 has been received telling of the adventures and successes of the parts.

The task which the American south polar expedition had set therefore perform in the opinion of RI grant and a state of the opinion of RI grant and the opinion opinion disaments as no one had ever landed in place where the exploring party purposed to land in place where the exploring party purposed to land in the opinion opinion

Dr. Le Faguays recommends a process of distinction which consists in lowlwing upon the contaminated surfaces a current of air hosted to a very high tempers ture (400 to 300 day F). This process may be applied not only within buildings, but also to be surreare of attents, paris, set: The superstate is beated race of attents, paris, set: The superstate is beated only destroys disease germs but it is very efficacious against fieus and other vermin.

Enhance has devised a process for the manufacture of sulphurie acid based upon the sumployment of the virviolet rays emitted by mercury vapor lamps. A mix tare of air and sulphurous acid gas is introduced into a tower, lined with lead, into which water is injected in fine jeis. Under the influence of the ultra-violet radiation of lamps in the tower, the sulphurous acid is entirely converted into sulphurie acid. Several coler are connected together. The stronger of the sail pulsar acid solution obtained in the first tower can be increased by sprarjor it instead or sairer, into the outlooked and the sail of the sail of the sail of the outlooked and the sail of the sail of the sail of the outlooked and the sail of the sail of the sail of the last tower however pure water is again used as soon a say sulphurous acid appears in the excepting gases

The Euppelin North Polar Exploration Committee on recently under the Presidency of Prince Head recently under the Presidency of Prince Head and Prof. Let and Service and Service of Prince Head Service and the Committee discussed the programme for the number's sork which will be devoted to a preliminary expedition for the pur pose of studying its conditions. The government will be acked for the use of the superiors were "Proceedings for about two mouths." The superiors were "Proceedings for about two mouths. The superiors were and three will transfer to the Postdom. A correction testing the superiors will be a superior of foreign as we are a superior with the purpose of foreign as we are superiors. The purpose of foreign are superiors and the condition of the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as we are the purposed to the purpose of foreign as the purpose of forei

MEW ARROPLANTS AT HOME AND ABROAD
THE TRADUCK NO. 3" ARRIVLANE.
A noteworthy acroplane so far as actual flying is
one-grand in the "Baddock No. 2 of Messre McCurdy and Baldwin, who are still working with Dr Bell nes Baddeck, Nova Scotia. As our photographs show, this biplane is an excellent flyer. It has made a consider able number of more or less lengthy flights above the ice of Lake Bras d'Or, in a number of which passengera were taken

The planes of the McCurdy and Baldwin machine

are 40 feet long by 7 feet wide at the middle, de-creasing to 5 feet at the ends 'the wing tips which are double and at tached at ach end of the main planes, are about 5 by 5 feet in size. They frost edges, and rocked is the usual manner by means of a fork fitting around the aviator's shoulders. The horizontal product opening of the state of the tal rudder consists of two superposed surfaces spaced 30 inches apart, and mounted 15 feet in front of the front edge the of the main surfaces. The surfaces of this rudder are 12 feet by 28 inches in size A biplane tail is also used, the planes being the san

as those which form the

as those which form the This best sepane assessor front rudder. This tail is mounted it feet from the rear edge of the main planes. The horizontal and vertical rudders are oper ated by a wheel in the same way as on the Curtiss biplane In other words, a push forward or a pull backward on the wheel directs the machine downward or upward Turning the wheel to the right or left steers the machine sideways.

The motive power of this biplane is a 6-cylinder Kirkham automobile motor of 40 horse-power It is water cooled and develops its rated power at 1,400 R.P.M., at 2,000 R.P.M. it develops 48 horse-power

The radiator is novel, consisting of thirty flattened tubes 7½ feet long by 3 inches wide by 3/32 inch thick. These tubes are curved from front to rear in the same manner as the main planes, and sufficient lift is obtained to support the weight of the radiator and water carried The motor is geared to a single foot shuch propeller having a 6 foot pitch, by means of a chain, the ratio being 3 to 6. The thrust obtained is nufficient to drive the machine at a speed of over

The Herring Biplane, showing novel stabilizing fins. such as foot operation of the horizon a skill instead of whosis, etc.

win a biplane are the use of a comparatively heavy 6-ylinder automobile motor and the fitting to machine of a biplane tail of the same shape and size as the horizontal rudder. The 8-cylinder motor has been found superior to the 4-cylinder for automobile work, but this is the first aeroplane, so far as we know, to be fitted with this type of motor The motor anow, to us attend with this type of motor. The motor is placed low down upon the lower plane in order to keep the center of gravity low while the propeller is mounted higher up, so that the center of thrust shall be as near as possible to the center of resistance

of the aeroplane. The usual three-wheel chains, first used by the Aerial Experiment Association, of which Mesers. McCurdy and Baldwin were members, is fitted

After making numerous satisfactory flights above the frozen surface of the lake, Means. Baldwin and McCurdy were visited on the 9th instant by Major Munsell of Ottawa, who represented the military de-Munsell of Ottawa, who represented the mintary or-partment of Canada. The two inventors made five exhibition flights for this officer, and finally be con-sented to make a flight as passenger with Mr Mc Curdy A very satisfac-

Curdy A very maisma-tory flight of several min-utes' duration was made. Mesers. McCurdy and Baldwin made a number of flights last summer and fall in Canada, and the Canadian government is very much interested in their machine, and will doubtless eventually purchase one for military use The noteworthy point about this machine is that its makers have built it sufficiently large to carry a weighty and relittle doubt that the maing extended flights with-out difficulty

THE NEW HERRING RIPLAND

The boat constructed accordance archibition at accordance on exhibition at the Boaton show, as noted in previous issues of this journal, was the new biplane of A. M Herring The photograph of this machine, reproduced above, was taken at the time of the trial flight on March Lis, and it gives a very good idea of the biplane's novel features. The spread of the planes is about 28 feet, and the foreft width about 4 feet, the total supporting surface being 220 square feet. A 25-horse-power Curtim motor Delig 220 square reel. A 20-norse-power Curtiss motor is mounted upon the lower plane at the rear, and car-ries upon its crankshaft a 4 bladed 6-foot propeller of 5-foot pitch, designed by Mr Herring. The total (Continued on page 246.)

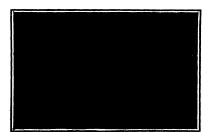

Capt. Baldwin's novel biplane. The radder above the upper plane is worked by a fork fitting about the aviator's aboutders. It corrects the skin-tipping of the scroplans,

## BUILDING THE CLIVE REIDGE DAM FOR THE CATHELL WATER SUP-

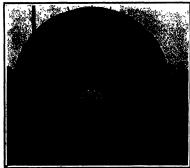

Work on the Catakill Work on the Catakili water supply, which will provide New York with five hundred million gallons of water daily, is making steady progress, as will be evident from the illustrations of this work which are horswith work which are herewith presented Briefly stated, the scheme constats of the construction of a large reservoir in the Esopus watershed in the Catakills, watersness in the Catasias, with a storage capacity of 127 billion gallons and an aqueduct 92½ miles in length for conveying the water to the New York city line The Ashokan reservoir, as it is called, will supply the city with 250 million gallons daily in addition to the 375 million addition to the 375 mili-ion gallons now available in the reservoirs of the Croton watershed. As the future needs of the city demand it, reservoirs will

Present condition of Olive Bridge dam as viewed from north bank.

be built in the Rondout and Schoharie watersheds adjoining the Esopus Val ley and from these three dams it will be possible to draw sufficient wa ter for the full capacity of 500 million gallons daily of the new aqueduct. The latter passes through the Croton watershed and in two years time, and be-fore the full completion of

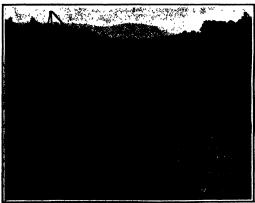

two years time, and be-fore the full completion of the Ashokan reservoir, as stored thereig will be available for delivery through the new aqueduct to the new Croton dam. The work is to be com-pleted by February, (vi) may be the work of the two the com-which will create the Ashokan reservoir, is a huge structure with a maximum height from the lowest foundation of 240 feet and a width along feet and a width along the complete of the com-pleted by the com-pleted the com-dition of the com-pleted for the com-leted for the com-leted for the com-pleted for the com-pleted for the com-pleted for the com-pleted for the com-leted for the com-pleted for the com-pleted for the com-pleted for the com-pleted for the com-leted for the com-leted for the com-pleted for the com-pleted for the com-leted for the com-tend for the com-pleted for the com-leted for the com-tend for the

#### Scientific American

All monograms German Fatout Sections.

A very important case was recently decided by the Saprima Court of the German Empire, First Civil Sensits, in which the rights of American patentees in Gurmany are defined. The facts in the case are briefly

The National Cash Register Company of Berlin. The National Cash Register Company of Berlin, a limited liability company incorporated under the Ger-man law, is the owner of three German patents. In Germany the patentee must work an invention within three years from the date of publication had expired for all four patents Proceed That term expired for all four patents stituted by Schubert & Salzer Machine Works in the Imperial Patent Office to revoke these patents on the ground that they had not been worked to an adequate stent in Germany, and that in all their essential parts the cash registers protected by the patents were manu-factured by the National Cash Register Company of Dayton, Ohio, and were imported from the United States Into Germany In its defense the Natio Cash Register Company of Berlin stated that one Ger-man patent had seep worked in Berlin, and that this at was in substantial agree ent with the Ameri can patent covering the identical points of invention, that the other three patents were not worked in the German Empire, but that their revocation would not serve any public interest. The Imperial Patent Office revoked all four patents, arguing that the one patent which was worked in Germany was not identical with the American patent cited by the defendant

to American patent circuit by the devicement of the from the decision of the German Patent Office on the promot that the German Patent Office on the promot that the German Patent Office word in helding that the German Patent Office word in helding that the German patent was not worked in Germany, and still setting up the old defence that the revocation of the remaining three patents would not further public intercompant of Patent Patents would not further public intercompant of Patents and the Company of Patents and the Company

The first question which came up before the court was whether the American company could be permitted to act as the defendant on appeal its view of the fact that the Gorman company had been the defendant when the action was brought before the Gorman Patter of the Company of t

Used was reversed.

In the way important decision, and and reference of the data of the start position before the difference courts, so far as forfaiture is concerned they as German scapiect. It is usually the object of a breaty to seem's equal rights to the contracting participation of the start position o

### A German Antaretle Expedition,

A German south polar expedition has been virtually arranged by Lieut Filchner of the General Staff, under the auspices of the Geographical Society Lieut Filchner announced at a meeting of the society that the expedition would start in October of this year if

the expedition would start in October of this year if the nocessary funds were forthcoming.

The plan is to send a vessel with provisions over the orate followed by Lieut Bhacktion and form a depot at about the half way point to Shacktions' winter headquarters. The require regoldtion would start later from Weddell Land on the opposite side of the opposite side opposite side opposite side opposite side opposite side opposite s

Dr Pentk, chairman of the Geographical Society an nounced that an anonymous donor had given \$75,000 toward defraying the cost of the expedition, and Lieut. Filchner had promises of a further \$15,000 It was hoped, he said, that they would be able to send out two vessels in order to save time

Lieut Filchner is an explorer of experience lie was one of the first to reach Lhassa, Tibet, and in 1903 and 1905 he explored Turkestan and Persia

#### The Life of Hadium

An interesting and informative popular lecture upon the wonders of radium was recently delivered before members of the Authors' Club in London by Si William Ramsay, KCB in describing the wonders of this element the eminent chemist confined himself mainly to a description of his own investigations and In dealing with the Alpha particles he ed that these were really gas, and quite twoexplaine capiamed that chose were really gas, and quite were thirds of the energy of radium was transferred to the gas which it emitted, which comes off at a regular rate, and this he pointed out raised the question as to how long radium would last. He replied for over, as the amount of gas was always proportionate to the amount of radium present. He likened this emission of gas to taking a silee of bread and cutting it in two ch operation say overpled a minute, and th ting one-half in two again, and so on continually out ting in two each successive half obtained. How long would it take him to cut the bread entirely up? He uld never do it. He would always be halving to infinity and the task would take him an eternity to It was exactly the same with radium ount of gas was always proportionate to the mass amount of gas was always proportionate to the mass of radium existing and was always being produced. There was however, he remarked, one point castly defined When would radium be half gone? They had just measured it in his (Sir William's) labora-tory and had found that it would take 1,750 years so that anyone who invested in radium would retain at least one-half of the capital at the end of 1,750 years The Austrian government some time age in trusted him with about half a gramme or one fifty fifth part of an ounce of radium for his private use Its value was about \$45,000 Less than a year ago Dr Gray and himself performed the experiment of Dr Gray and himself performed the experiment of isolating the Alpha emanation of radium, and they included it in a fine giasa tube, much their than the finest thermometer tube that was ever made. They compressed it and liquefed it. In the latter stage it, shose with a purplish light, although it was quite transparent like water. When reduced to a tempera-ture of -00 dec Cent it collided and then it per with an extremely brilliant light like a ministure of the control of the control of the control of the performance of the control of the co with an extremely ordinate agent law a manager electric are light. The quantity they used was extremely small, being less than the point of the finest needle, yet they ascertained its boiling point, its melt

Radium was the most concentrated form of energy known It is a substance which goes on changing into other things to which various names have been

ing point, and its specific gravity

given These substances were named radjum A, redum B, radium C and so on up to radjum P Some had a very brief existence insting only thirty or forty mitutes, and he had never seen them. It had seen radjum D which would be gone in about forty years. This was a substance where dull nothing like lead were other substances probably like pointsim which Madame Carlo disevered During the . manations radjum gave a great deal of energy generally manifested as light but see matter of her radjum kept listed hot, there was a great deal of heavy listed hot, there was a great deal of heavy for the reduced in the control of the radjum kept listed hot, there was a great deal of heavy for the reduced in the control of the radjum kept listed hot, there was a great deal of heat gone radjum of the control of the radjum kept listed hot, there was a great deal of heat gone radjum kept listed hot, there was a great deal of heat gone radjum kept listed hot, there was a great deal of heat gone and the great listed was a supplied to the control of the

given off by the oxylpringen blowpipe, which gave a temperature of aver 2500 og Cent.

What did this 'mergy do' it sent to the Alpha rays at a velocity of about 4000 miles per seend, and these partities naturally carried a great dal of overey. The Dear arays, although only about our thou sendth sent of the site above carried this control that of the Alpha rays. They could decompose water and metallic substances, and in these decompositions that of the Alpha rays. They could decompose water and metallic substances, and in these decompositions that of the Alpha rays. They could decompose water and metallic substances, and in these decompositions to arise in the substances so treated. For instance in documposing ordinary copper sulphate they were surprised to discover lithium in what remained, and no traces of the copper sail. He had repeated this experiment fee times, and the experiments were still scoling on

The bacteria also have to contend with the late for means the development of the permitted of

THE BRAZILIAN BATTLESSIP "RIFAS GERAES" in the early part of this year the first of the dread nought battleships the Muass Geraes" about which much speculation has been rife, was handed over by the builders, Sir W Q Armstrong, Whitworth & Co

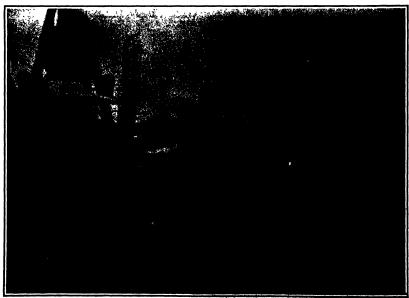

of Elenick, Newcastle-on Tyne, to the Brazilian government thus definitely disposing of the supposition that the vessel was designed for some other power This vessel has been the source of considerable discussion, since it represents the last word in heavy bat-

ticably design, and is at present the most payerfully arised warship adost. Through the courtesy of Admiral Maurity, the president of the Brazilian naval commission in England, appointed by the government of the South American state to supervise construction,

Length, 60 feet. Breadth, 86 feet. Normal displacement, fight, 1400 ton. Horse-power, H.H. Speed, H. & toots. Armors. But. blmb, extending for full height of hell, turned, blmb; two protective derks. My not not for two Armoneums: Tweire-desibles likely, twenty two Crust. Pow tourpeds tables.

TER BRAINGERS WITHER SERELES."

Busing the gun trials of the "Bians Gernes" ten 15-meh guns were trained on the breaksile and discharged simultaneously. The combined energy of the projectiles amounted to 500,000 foot-tom, or sufficient to lift the pair hedily 26 foot larts the air.

we are enabled to publish the accompanying photographs and to give the leading particulars regarding this, the latest freadounght.

The general appearance of the vessel may be gathered from the accompanying illustration. The oversil length is 548 feet, modded breach 33 feet, modded all length is 54% feet, molded breadth 33 feet, molded depth 44.55 feet, displacement 19,000 tons, speed 31 knots. The propelling machinery, built by Vickens Sons & Maxim, who have the second vessel of the series completing at Barrow, is of the reciprocating four-cylinder triple-expansion type, driving twin three-bladed propellers. The critinders have a diameter of 29 inch 39 inches for the high-pressure, 63 inches for the inter-mediate, and 73 inches for the low-pressure, with a common stroke of 43 inches, and on the forced draft trial at 280 pounds pressure developed 27,212 indi-

ated horse-power, giving a speed of 21 4 knots. The outstanding feature of the vessel, however, is and outstanding feature of the vessel, however, is the armament. The main armor on the broadside amidahips is 9 inches for a depth of 22.3 feet, 5 feet of which extends below the normal load water line. The forward and aft barbettes are protected by a trans-The forward and are partiettes are protected by a trans-verse 9-inch armor bulkhead, while forward and aft the hull is protected by 6-inch bolt armoring tapering to 4 inches at the extreme ends tective decks, the upper being 1.25 inches thick, and the water-line deck 2 inches thick Nino-inch armor is also used for the upper strake amidships, and the 4.7 ch guns of the secondary armament are mo inch guns of the secondary armament are mounted with in the citadel thus formed In regard to offensive arm

ament, the main twelve 13-inch 46-caliber guns Four are carried in pairs in two in center line of the ship, both for-ward and aft, the remaining two
pairs being
mounted on either side amidships in order to permit e to be trainthese to be train-ed throughout a full are of 180 degrees, the super structure is cut away fore and aft. It will be readily seen that the upper deck of the vessel is left clear of all obstruction, a factor the outstanding features of the de sign It will be pairs of guns for-ward, as well as those aft, are stepped, the uppermost pair be 12 feet above the level of those below, so as to enable the up-

per to fire over the lower pair It will be seen from this arrange-ment that a terrific gun fire can be concentrated on either side, for the forward and aft two pairs of guns to the side, for the forward and aft two pairs of guns the side of the can be trained through an arc of 150 degrees on either side of the center line of the ship, thus giving å fire from either broadside, including the pair of guns amidfrom either broadside, including the pair of guns anid-ships of ten 18-inch guns. Moreover, owing to a pair of guns fore and aft being sot at a higher elevation, they have a corresponding advantage in action. As have a corresponding advantage in action aguns fire a projectile weighing 850 pounds, this it that an aggregate discharge of 8,509 pounds concentrated from either broadside. In the acthese gu companying photograph taken during the gun trials de fire is shown, and this is interesting as it is the first occasion on which ten 12-inch guns have been fired from a broadside. Similarly owing to the amidship guns on either broadside being capable of training through an arc of 180 degrees, it is pos-sible to fire eight 12-inch guns ahead or astern.

able to fire eight 15-luch guns ahead or astern. The secondary armanent comprises 47-inch guns and 2 pounders of the quick-dring type. The central superstructure of the vessel has been so designed as to carry four 4.7-luch weapons arranged in pairs one above the ether on either side of the bridge at the forward end, with a simple dispersion aff. These guns fire forward and aff, partiall with the control line of the ship, but have a considerable ships of fire sharf the beam. Also set a beyenders are similarly monated forward and aft in the same superstructure, while two other 2-pounders are carried on the top of each of the

gun houses of the upper level pair of guns. On the main deck there are seven 47-inch guns mounted with-in the citacle of 9-inch armor on either side, and the arrangement is such that the guns can be trained through an are of 26 degrees on either side of the cen ter line transverse to the keel, so that they can be trained astern and ahead Altogether there are twenty two 4.7-inch guns included in the secondary armament The result is that is action the vessel can pour a broad side from ten 12-inch guns firing 50-pound shells, eleven 47-inch guns firing 50-pound shells, and six guns firing 3-pounder projectiles. As all are of the latest quick firing type, a comprehensive idea of the formidable character of the attack of this vessel may be obtained

rating mechan The gun-op hydraulically driven, electricity being used for training the turrets. In addition there is emergency gear for every operation. Immediately the gun is fired an or every operation immediately the gun is free an air blast cleans it and the rammer is fitted with a water spray, so that in the event of any sparks remaining when the breech is opened they may be at once extinguished. The arrommodation for the per sonnel is most adequate and commodious especially in rd to the officers' accommodation, and in view of the hot climate in which the vessel is to be in service. special attention has been devoted to ventilation navigating bridge has outer wings, which are also re-moved when the ship is cleared for action. The gunnery trials created unusual interest, and

This graceful structure, recently completed, takes the place of a primitive rope ferry.

#### THE FIRST METAL BRIDGE TO BE RESCUED IN AVGRAGISTAN.

the representatives of several powers were present therest. The trials served to dissipate conclusively many apprehensions that had formerly been enter tained For instance, there was considerable discussion as to what effect would be produced upon the gun crew in the lower barbette of the fore and aft 12inch guns when the weapons immediately above were discharged. In the first test the crew were withdrawn from the lower gun house when the upper pair was It was found, however, that the roof of lower house offered a complete protection against the blast, and that the crew could safely stay in the lower house without experiencing the slightest ill effects of the tremendous blast some five feet above their heads It was also considered that the principle of setting the fore and att guns one above the other and at a dis-tance of 36 feet center to conter was objectionable, on the plea that the aiming of the upper guns would be end with by the flash from the guns just be interfered with oy one man from the gules just below, but here again practical trials dispersed any such ob-jections. These results, by the way, corroborate cer-tain results obtained some years ago by our own Navy Department at Indian Head, when this syst counting, first proposed and adopted in our an" and "Bouth Carolina," was tested.

Cement for Aquaria - Equal parts flowers of sulphur, pulverized sal ammoniac and fron filings, mixed with ed oil varnish and adding enough white lead good linseed on varmen and secting on to make a solid, easily workship mass.

THE PIRST METAL BRIDGE IN APPRAISITAN

The accompanying illustration represents the Di-roomtah suspension bridge, the first metal bridge to be erected in Afghanistan, which was opened last year. The structure apans the Kabul River at the mouth of the famous Diroomtah Corgo about seven miles from Jaliabad Prior to the erection of the bridge communication was maintained between India and communication was maintained between inqua sine the adjacent country by means of a primitive native forryboat, or raft, composed of akins stretched taut on a framework of rough timbers, and lashed to-gether by means of crude native-made rope. A cable was stretched across the river, and when the latter was at its normal stage the raft was pulled from one bank to the other by this means When, however, the waterway was in flood, and the turb velocity of the current prevented recourse to the rope the raft had to be rowed across the river, an operawhich required considerable dexterity with the primiwhich required considerable destretty with the primitive cars used. The journey was somewhat dangerous under the circumstances and the opposite bank was only gained some considerable distance downstream. Owing to the rude character of the ferry-boat a capsite was by no means infrequent, and indeed several lives were lost from this cause every

chosen for the structure was just off the old Kabul road As the photograph shows, the gorge is extremely wild at this point, the rocky cliffs dropping straight down

The contract was carried out un Mr J R Halli day by the Cai-cutta engineering firm of Messrs. Rurn and Company, Limited

The bridge has a enen of 396 tower centers. width between parapets of 10 feet. It is designed for pedes-trian and light vehicular treffic character of the with the fact that none but un skilled native labor was available, rendered the task somewhat diffi The abutments had to be solid rock, as did the roadway approsches on either side On the these preparawith the setting of the foundation bolts were con

pleted in seven and a half weeks. Work then had to be auspended for seven months, as the services of the Afghan labor was required in Kabut Upon resuming operations, work was continued without further inter nission and the bridge was erected in the actual corking time of five months. Considering the nature of the work, and that the native laborers were quite unacquainted with the tools used such a performance was highly creditable A further month however was d in blasting out a roadway and approach to occupied in blasting out a roadway and approach to the bridge in the cliff face on the Lagna side of the river. The bridge was opened by His Majesty the Amir of Afghanistan amid much ceremony and before huge crowd of natives, who lined the precipitous hillsides to witness the novel spectacle

Until a few years ago, all public coal lands were Dutil a few years ago, all public coal lands were valued unformly at a raise of 320 or 510 an acre, ac-cording if they lie less or more than 16 miles from a railroad Silver July 1906, the government has been appraising its coal land according to the value of its contained coal. The present value fixed for the government coal land, based on the new requisition, is 184(77,344), the value fixed for these same coal lands before the new classification was adopted was \$48 240,971 According to these figures, it is evident, there-fore, that if these lands had been sold at the prices prevailing before July, 1906, they would have brought the government about \$190,000,000 less than their value

#### BIRDS AS MEGRATISMS

ST S S SOUDISM.
The casual observer knows the birds as he knows the tree the stone or the sea shell—an incidental object of passing interest, one of the trivial details in his every-day life. The novice bird student knows in his every-day life. The novice bird student knows the birds, few or many species, by the clothes they wear no to speak. If somewhat adept, he may even revenue birds by flight and song Even the more profound ornthologist classifies birds by external character—largely bill feet, length of wing and tail, number of feathers in each, etc. He is of necessity a specialist paying particular attention to classifica tion pterography of the study of plumage ornith ological osteology or some one of the sub-divisions of the ceneral study of birds. Lew individuals among appreciate the bird as a mechanism designed to play a certain part every member like every detail of some complicated and perfect machine contributing toward perfecting the whole for its requirements Considering the bird from this standpoint and

100

analyzing the parts with a view to their functions it seems natural to con mence with the bill cause it is the anterior extremity and because of the importance of its a birds mechanism article capecially devoted to it and has, in fact ceived such treatment. It be briefly reviewed here The bill not only performs the func-tions of a mouth in birds, but also serves as a hand posterior limbs, and only unsatisfactory substitutes on the anterior ones. bill largely in lieu of a hand, and do so to a very considerable degree

As has been shown, the

as has been shown, the bill largely conforms in shape to the requirements of the more important functions that it must very wide range of vari ety in sise and shape It is used for cutting tearing, and chewing fo various sorts, and for seizing, spearing, or en-guing prey It is also used to dress the plumage, and by some species, such as parrots, to assist in climbing Birds' skulls, having a

less diverse range of functions than the bills, correspon amaller degree of differ entiation, but they do vary to some extent according to the habits and particularly according to the orders. In the lower types, such as greb and most of the sea birds, the brain cavis relatively small, but proportionately large

in the higher types, such as the thrushes including

The vertebral portion of the skeleton plainty indicates the bird's descent from senestral stock common with that of reptiles. Modern birds being no louger provided with reptile-like tails, as was the case with the earliest types (the archeapteryx had twenty cauda the earnest types (the archeaptery man weathy caudain vertebres the bony structure of a long lisard like tail, each vertebra supporting a long feather on either side) the number of caudal vertebre has become re-duced to usually nine and these are short and with little apparent function, other than to support the feathers of the tail, fan like, about the outer bone

The bony structure of the wings is an adaptation of the bones of fore limbs to the requirements of flight In evolutionary history this adaptation was princi pally accomplished in the lizard like progenitors of birds and the modifications since then are not remarkable. The main arm bone the humerus and the secondary ones the ulns and radius are not very differ

titled Bills by B. S. Sowdish, Augertean Bonnes and Cardina, July 1993, vol. iii, No. J. pp. 85-87

ent from the corresponding bones in man the hand, however, the first and fifth fingers have disappeared the index and third digits are small and scarcely functional, while the middle finger is greatly developed and furnishes the real bony support for the tip of the wing
Wings for the great majority of birds are solely

organs of flight, in a few species such as the ostrich they are rudimentary and functionless serving at best only to preserve symmetry in such species as

best only to preserve symmetry in such species as ponguins, howevor, while useless for flight, they are valuable as flippers or paddies, assisting progress through the water in a very two cases they are used to assist the bird in timbing usually largely while immature, as in the hoatsin of South America
Next to the bills and wings the feet of birds are
perhaps of the greatest functional importance. Feet

and logs vary greatly, according to the usage for which they are designed. In the ostrich, which most nearly resembles in its mode of life some wild horse the development of feet and legs is strikingly like that of the feet and legs of such animals. Birds like

the birds than the skeistal structure. The more i the pires than the sketstal structure. The mere im-portant nucles are peculiarly designed to reader the greatest efficiency. The powerful muscles that operate the wings have their anchorage on the keel of the breambone, and the latter is particularly deeply developed in birds of most powerful flight. This is true alike of the man-of war bird, with its immense wing area to maintain spread for hours in sailing, and of the humming bird with its relatively small wings. driven at lightning speed to keep the bird pois fore a flower

In all of the passerine or perching birds, the muscle and tendon arrangement of feet and legs is such that the weight of the body resting on and contracting the the weight of the body resting on and contracting the legs draws the muscle over the main joint, and draws up on the ends of the toes, looking their grip on the perch. The same principle drives the talons of the hawks and owls into their prey

hawks and owis into their prey
Tongues in birds are also highly functional In
woodpeckers they are practically barbed spears, and
the extreme protrusion that they are subject to is
provided for by roots that extend around the back

of the head and clo to the eve-sockets In the humming bird the tongue is a pump for obtaining the nectar from flowers. In some species it is brush like, to facilitate handling the food, and in certain fish-eating species the upper surface of the tongue is covered with points inclined backward, lo facilitate awallowing the slippery prey
The eyes of owls, de-

signed to see at night, are wonderful structures Only a small portion of the entire eye-ball is visible Each so ket occupies nearly a third of the total skull space The visible eye-ball is mounted on a thin bone frame, some-what resembling a lampshade in shape, a struc-ture differing radically from the type of bird's

The feathery covering of birds is especially adapted to their requiresubjected the penguins it is more like the hair of seals than thoroughly waterproof greatest supporting area for the air pressure to act

ments It is light offer-ing the least weight to be carried in flight, and a poor conductor of heat and cold, affording the bird the best protection in the sudden temperature In birds like The feathers of ducks and water fowl generally are ulso practically water-proof The power of flight is quito dependent on the feathers both of wings and tall which in action

the kingfisher and humming bird whose feet are t solely for perching have absurdly underdoveloped, small, and weak looking feet and legs. In the birds of prey the feet are practically grappling hooks, de-signed to secure the firmest hold of the victims, the legs are heavy and strong Birds like the hero storks, and eranes, who spend much time wading, have very long legs and long, slender toes, which, spreading over a wider surface, give a support ana-logous to that afforded by snowshoes. This feature is more strikingly illustrated in birds like the rails, that travel about on the yielding aquatic growth, and finds its highest development in the jacanas, tropical finds its highest development in the jacanas, tropical and sub-tropical Jirds of the rall family Wood-peckers creepers, and nuthatches, birds that clins a great deal to perpendicular surfaces, have very sharp claws and feet adapted to such requirements. Birds that swim a great deal have the feet webbed with a membrane extending between the toss, making very officient medical process.

efficient paddles

The flesh of birds is no less efficiently designed and
disposed toward the fulfilling of the requirements of

ism, so perfectly do all its parts contribute to an absolutely smooth-working whole, in the bird, that the very wonder of this

Metal filament lamps generally are supp of a pretty frail nature, so that the alightest touch breaks them. This idea is counteracted by an account a Pennsylvania eastbound passenger train and an empty engine just outside Jersey City on the morning of November 8th This accident resulted in comparaof November 8th This accident resulted in compara-tively few injuries to the passengers, due to the fact that the strong frames of the passenger cars resisted crushing The damage to engines and cars, however was considerable. One of the steel passenger conclus-jumped the track and turned over on its side, desting in the steel plates about 13 inches. Included in the lighting equipment of this car were nine tangates, lamps, and it is interesting to note that, after-to-week three lamps were found to be in perfect dos-week three lamps were found to be in perfect dos-

### EXPERIMENTS IN CRYSTALLIZATION

The making of crystals of various kinds outside a chemical works or chemical laboratory is not often practised, because it is commonly considered that the subject is a very difficult one or that it requires a complete knowledge of chemistry Such however, is a mistaken idea from either standpoint Crystals of extraordinary beauty both in geometrical form and brilliancy of color can be produced by any person debrilliancy of color can be produced by any person de-termined to make the undertaking successful.

The accompanying illustration shows a group of py-

amidal crystalline structures that have been form in the national colors

The red is made of bichromate of potash, the white of common alum, and the blue of sulphate of copper

Many salts can be employed that are very cheap, and after the crystals have been formed the solution left over can often be used. The geometrical forms of the crystals can be observed during their formation, and it is interesting to watch how they grow as the liquid deposits the excess of sait. When finished, they can the excess of sait be dried and preserved under a glass covering like wax flowers so as to preserve them for ornament and war flowers so as to preserve them for ornament and for educational purposes To produce results as illustrated make a pyramid

out of three pieces of wool five inches long, and a quarter of an inch square. Wind each stick with cot ton twine from end to and Bind these three st well at the apex of the ovramid and then for the base nake a little triangle of the same sized strips each pince being two and a half inches long. Coment these piete being two and a nair milest long. Cement these firmly at the corners with swaling wax, then cover every part neatly with a winding of cotton twine. Now distend the free ends of the three longer pieces, and fasten them to the base with sealing wax after which carefully cover all the waxed parts with twine For a fine pyramidal block of white transpar ent crystals prepare a small quantity of concentrated alum solution made by adding powdered alum to pint of boiling water until no more will dissolve. Dip the cotton twine covered tripod or pyramid into this solution, let it soak for a minute, then stand it in a plate to cool. When cold it will be coated all over plate to cool. When cold it will be coated all over with very fine crystals of alum. This is the starting point to build up the flual crystallization. Examine the minute crystals with a magnifying glass, when it will be seen that the face of each crystal is triangular the corners being out off small or how large the crystal may be, it always asmes the same geometrical form, for every sait crys tallizes in a form according to its nature

tainings in a form according to its nature.

Proure a two-gailon stoneware trock and a one-gailon glass battery jar. The battery jar should be eight inches high and six inches in diameter. Pour even pints of boiling water into the stoneware crock. Add thereto about five pounds of powdered alum, a fe

ounces at a time stirring the solu tion well with a clear strip of glass. As soon as the hot water will dissolve no more alum it is then saturated and must be poured into the glass battery jar, which has been previously warmed, straining the solution of alum by tying a three-fold place of che cloth over the top of the jar Now place in the battery jar a circular-like lid about ¼ inch deep, such as the lid of a paste jar Sat upon this lid a place of glass four and a half inches square and upon the glass the slightly crystallized pyramid completely immersed in the solution and weighted down with a large alum crystal or a beavy glass stopper A small crystal of alum may also be tal of alum may also be ed upon the top of the pyramid

placed upon the top of the pyramid All must now be left to cool gradually. Under io confliction must the wessal be distribed, because the would cause the alum to be threen down in a few minutes in very fine crystals like common said.

At the end of west-four hours, the whole of the pyramid will be covered with beautifully furned crystals. At the end of torty-eight hours, the pyramid may be removed, and the slum believels make hot over anows. adding more ground alum to saturate the solution; nour this solution again into the Battery far and insert the pyramid with the sheet glass base, allow this to

stand for a week, when it will be found to have become a mass of beautiful crystals, clustering into one solid mass. The pyramid must now be removed (the glass plate also by a slight tap) a pint of clean, cold water poured over it, then stood upon folded blotting paper to drain changing the blotting paper twice daily for a week to nine days, when it will be found that the crystals will become almost transparent. The pyramid being complete it may now be covered with a suitable glass dome and it will form a unique and instructive ornament Several sets should be made from various salts, in various colors All of them can be carried out

ely the same manner as described for all The following salts are not expensive and will give the various colors stated They will not become moist upon exposure to the atmosphere For white common alum and cane sugar, red potassium bi chromatc, yellow, yellow prussiate of potash, dark green, double sulphate of nickel and ammonia light chlorate of nickel

There are very many other salts that will give a

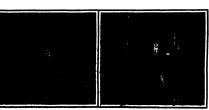

RED. WHITE, AND BLUE PYRAMIDAL CLUSTERS OF

great variety of colors the majority of them being deliquement becoming moist and melting upon ox posure to the atmosphere but those enumerate

#### SIMPLE METHOD OF PRODUCING THE ZERMAN REFECT BY W & (40)

The world was startled when a few years ago, Pro-Zocuma amounted that if pieces of sodium were burned between the poles of a powerful electromagnet the spectroscope would show the D line much broadened while the axisting current was turned on, and that the original aspect of the line would be reed as soon as the current ceased

The experiment confirmed the much-discusse The experiment continued in more unusual control of the chemistry of the Lorentz who assumed that the litherte bomogeneous and indestructible atom of the chemistras as a matter of fact heterogeneous and composed to the chemistry of the chemistr of minute particles or vortices in the other of space, having a definite mass and possessing all the proper ties of negative electricity. These particles, or vor-tices, which are now called 'electrons' he conceived as vibrating about the common center of gravity of the atom and further that light was due to trans-verse vibrations in the ether generated by these rap idly moving electrons if argued Lorentz, the atom up of such particle e or vortices, their rate of vibration would be altered by the lines of force in a magnetic field and we should be able to predict their behavior with accuracy. Going back to two swinging pendulums for analogy, he pointed out that any mo-

APPARATUS FOR PRODUCING THE SEMMAN REFERT

tion to which the electron is subject could be resolved into three components one in straight lines parallel to the lines of magnetic force, and the other two at right angles to them, but since these last two can be truther rooted into two circular motions (one to the sight and one to the left) around as axis parallel to the lines of force, we can say that the motion which to the inject of force, we can say that me motion which the electrons are, capable of making may be divided into component number 1 in which the electrons are moving parallel to the lines of force; component num-56 2 in which they move with the hands of the clock.

and component number 3, in which they move against the hands of the clock. Now suppose we look at the vapor of sodium in a magnetic field and along the vapor or section at a magnetic neighborhood along the inlines of force Consider the electrons an angalitely charged, and the lines of force runnin oward you what will happen? You caunot see any "feet of component number 1, since the electrons o that component number 1, since the electrons o that component nent are moving in the line of your vision and since electrons emit waves only at right angles to the line of sight, hence to see the waves of component num ber 1, you would have to move your position and look at the burning sedium at right angles to the lines of force But with components numbers 2 and 3 the conditions are very different. Here the electrons are revolving in circular orbits and in a plane at right angles to the line of sight, and since those which move with the hands of a watch are retarded, and those against the hands of a watch are accelerated the single line seen in the spectroscope would split into two, or as in Prof Zeeman's case, where the spectroscope was of small dispersive power only a broadening of line would be observed. This then, was the experiment which startled the scientific world, startled it because one of the fundamental principles of science was apparently overthrown-the homogeneity of the atom of the chemist

Notwithstanding its value and significance, the experiment is rarely witnessed because of the pond ous and costly apparatus necessary to produce the di-vision of the spectral lines. Powerful gratings and magnets both exceedingly expensive have up to the present time been used in the demonstration. The writer however has a very simple piece of apparates costing less than \$40 with shows the phenomenon admirably. No claim to ortiginality is made save in the matter of its arrangement which is no simple as to be well within the grasp of any intelligent boy. instead of the powerful spectroscope the reader will observe in the accompanying photograph a little inter ferometer attached to the triescope. This is a modification of Fabry's and for it the writer is indebted to the inventive genius and the exquisite mechanical ingenuity of Prof Pfund of Johns Hopkins Univer-sity And instead of the huge magnet used by Zeeman one weighing less than forty pounds is found more than ample. The photograph shows a piece of board six inches long to which is attached A a lens of three inches focus, B a Nicol prism which can be revolved in its brass collar C the interferometer D the telescope and O a spring ellip for holding the quar ter wave plate. This apparatus is simplicity itself is always in adjustment and can be rapidly shifted to view the phenomenon along the line of sight and at right angles to it

Instead of burning sodium let us use a tube con taining helium gas, and place the apparatus se we may view the light parallel to the lines of force and through the hole drilled in the pole piece of the magnet as seen in Fig t. Examine the glowing tube before the magnet is energized and you will see several concentric yellow rings in the field of the tele-

Fix your attention upon any one of the rings which is the equivalent of the yellow line that would be in an ordinary spectroscope Turn the current into the magnet, and lastantly the yellow ring splits into Revolve the Nicol but you cannot extinguish the rings because just as Lorentz predicted they are circularly polarized. Now introduce a quarter wave plate the effect of which is to

produce a retardation of one-half wave length. The light is now plane polurized and can tinguished by the Nicol—a further and a beautiful confirmation of Lorentzs theory. Ho much for components numbers 2 and 3 but component number 1 can not be seen since its electrons are moving parallel to the lines of force. Now take out the Nicol and move the apparatus so as to view the light at right angles to the lines of force (Fig. 2) Turn on the current yellow ring is observed to break up into three Let us analyze them bearing in mind what Lorentz said viz That one of these lines component number

1 was polarized lying in a hori-e, and that the other two, components num bers 2 and 3, were polarized in a vertical plane ver-tical because in this position we are looking at the edges of these circular vibrations, and the effect upon us is as if the particles were actually moving vertically now introduce the Mool with its short diago-nal vertical, two rings appear, and with its short diagonal horizontal one ring appears a beautiful con firmation of one of the cleverest places of reasoning two refedited to the midd of man. In the whole resim of physics there is nothing mor-

striking, more significant, and the effect which it is destined to exercise upon the future of science is simply incalculable

#### SOME SIMPLE TESTS FOR OILS.

There are several tests which anyone can apply without the use of special apparatus, and tell something about the grade of lubricating oil he is getting THE PLANT TEST

Piace a small amount of the oil to be tested in a

APPARATUS FOR DETERMINING THE FLASHING POINT OF OIL

pan as indicated at a in the accompanying engraving, pan as indicated at a in the accompanying engravity, and heat by means of the lamp beneath As the oil heats apply a match at b. After a time a flash is seen when the match is applied, but it disappears as rapidly as it came. This shows that enough vapor had been produced to milk with the air and form an explored mistare. The temperature, given by thermometer, at which this over, is called the flashing point, at some higher temperature if a match is applied, the oil takes after a "This interest measures is considerable," the oil takes after a "This interest measures is considerable. oil takes fire This latter temperature is known as the burning point, and may be a considerable numb of degrees above the fashing point.

### TO DETECT THE PRESENCE OF AN ACID. Dissolve a small amount of sodium carbonate in an

equal volume of water Place it, together with the oil to be tested, in a flask or beaker and shake thoroughly The quantity of precipitate will be a gage of the amount of acid present.

TO DETROT THE PRESENCE OF GRIT Drop a small amount of the oil on white or very light-colored blotting paper. The oil will be absorbed, and the grit will be visible as small black specks on

TO FIND THE TYMPERATURE AT WHICH THE OIL CONGRALS Put 15 parts of Giauber saits into a beaker Place in this a bottle containing a sample of the oil. Place over the sait a mixture of 5 parts hydrochloric acid and 5 parts of cold water The temperature is re-duced slowly, and can be observed from time to time as the oil thickens Any freezing mixture or even to can be used in place of the above

#### THE IONISATION OF AIR.

SOME SIMPLE PAPERIMENTS The terms ions and electrons have now become familiar in the explanation of electrical phenomena Most of the investigations upon which they are based how ever have been made in racuo, and consequently the are but little understood, except by those scientists

who have devoted their energies to their e study There are however many simple experiments, mostly due to Right, which can be made in air at the ordinary pressure, and which form a useful intr ordinary pressure, and which form a useful introduc-tion to the study of icelastion The accompanying illustrations represent some of these typical simple experiments performed by Mr C J Waxda of Bir-mingham, which aroused considerable interest at a re-cent actentific conversations in that city, and through his courtesy we are able to explain how they were carried out and how they may be repeated by any inter-

It is well known that if a pointed wire be con-It is well known that it a pointed wire of con-nected to one pole of an influence electric machine, and the other pole is earthed, a discharge of electric-ity will be obtained. The proof of electric discharge may be easily verified by means of a lighted car and a gold-leaf electroscope if the former is placed on the cap of the latter, the electroscope, even if dis-posed several yards from the machine, will collect continuously the electricity discharged from the u chine Similarly, if the action is carried out in the dark, a small stream of purple light may be seen, which although scarcely visible, will exercise a pronouncedly marked influence upon an exposed photographic plate Another method in which this discharge may be ascertained is to place a condensor, charge may be ascertained is to place a contensor, comprising a piece of glass 1/16 inch thick coated on both sides with tinfoil to within ½ inch of its edge, opposite the point of the wire Then connect the two opposite coatings of tinfoil with a strip of the same material, which has a fine cut in it When the reverse side of the condenser is connected to earth, there will be a distinct spark jumping across the par row gap

If this discharge point then be immersed in a metal If this discharge point teen be immersed in a measu-box fitted with an opening which is covered with per-forated zinc, so that the electrified air is forced through the perforations, if the box is earthed it will be found that the air which is thus expelled is totally deprived of electric charge. It thus appears that the

clectric charge is not carried by the particles of air generally, but by a smaller number of what for the present are generally described as ions. Reversi simple experiments may be carried out to

Reveral simple experiments may be carried out to saccriain the paths pursued by these ions. For in stance, take a sheet of ebonite the reverse side of which is coated with tinfoil and earthed, and place it a foot distant from the discharge point. It is advi-able to pass the abeet over a gas flame for a few seconds before each experiment, so that any electricity present in the sheet may be eliminated When the discharge from the electric machine is carried out for about one second, the sheet will be charged suffi ciently No visible effect of this occurrence will be

observable; but if the sheet is sprinkled with a mix-ture of powdered red lend and sulphur, and the same experiment is repeated with an obstacle of non-conterial interposed between the ducting material interposed between the disoharge point and the sheet, such as say a cross, an image of that object will be produced upon the plate. If nega-tive electricity has been discharged from the electrical point, then the sulphur will collect on those parts

Fig 12.-Forcing a discharge through a size sieve

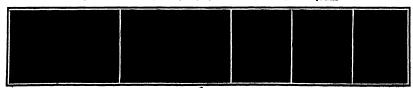

Fig 18.-Rffect of ultra-violet rave on sinc

ediately beneath the object, while the red lead will adhere to those parts charged negatively by unimpeded discharge on the surrounding areas drawing, Fig 1, shows how the experiment is carried out, while the photograph, Fig 2, gives the result of the interposition of the cross in the path pursued by

are image or the object is usually enlarged, but this factor is influenced to some extent by the length of time of the electric discharge. A proferable method is to take a sheet of celluloid, as shown in Fig. 3, perforated with holes at regular distances. Than when The image of the object is usually enlarged, but this forated with holes at regular distances. Then when the image of these holes is obtained, as shown in Fig. 4, the distances between their centers can be measured When the distance of the ebonite sheet is varied (the when the distance or the spontie sheet in wated the distance of the ceilindid sheet from the electric pole being kept constant) it will be found that the size of the image grows with the distance, but not proportionately. The electrified particles or ions travel along the lines of electric force, and consequently generally in curved lines. This has been proved by using, in stead of a point, a long thin wire held parallel to the interposed sheet of celluloid when the lines of force tre circular ares passing through the wire, and strik-

ing the ebonite perpendicularly to its surface
It will also be found that the streams of ions mutually repel each other, so that if the electrified point very near to the celluloid, the individual imof the holes will be found to have enlarged themselves at the expense of the intervening spaces and will even be observed to have assumed almost a square form, as be observed to have assumed almost a square form, as shown in Fig. 7. This is of course analogous for what is observed with the cathode rays of highly exhausted tubes. A similar repution is also manifested when an insulated metal object is used as the interposed ob-ject. This is illustrated in Fig. 6 which represents the effect produced by a place of brass sinking on the ond of an obsolute rod, both bulley of the same diameter (Continued on page 250)

Figs. 8 to 8.—Shadow effects produced by interposing non-conductors in a stream of electrified particles

Figs. 7 to 11.—The effect of an air black on the discharge, and of ferring a discharge through perfected also.

#### NEW ARROPLANCE. (Continued from page 236)

veight of the machine complete is about 400 pounds from the propeller at 1,200 revolutions is in the neighborhood of 200 pounds. The double surface horizontal rudder is The double surface horizontal rudger is carried upon hollow inclined poles some 12 test in advance of the main surface, and the single surface tail is similarly carried at the rear. The machine is mounted upon a central runner having two amailer skids at each side. There also a skid at each and of the lower plane

The novel features of this machine The novel features of this machine are the foot control of the horizontal rudder, and the system of triangular vertical flus on the top of the upper plane for the purpose of maintaining the plane for the purpose of maintaining the transverse stability automatically. The aviator sits upon a small seat located in front of the lower plane and clings to two inclined braces running out in front to vertical strain connecting the poles that hold the horizontal rudder These inclined braces can be readily seen in the photograph as well as the podals for the feet of the aviator which operate the horizontal rudder. The vertical rudder is worked by a small lever held the aviators right hand, and the spark and throttle control of the motor is also conveniently placed

The theory upon which the transverse fins (each of which has about 2 square feet of surface) operate in order to maintain the transverse stability of the machine, is as follows When the mathine tips to one side it has a tende to slide down toward the ground end wise, but as the weight is placed very low and as the fins offer resistance to this side motion the upper part of the machine is retarded, while the lower part swings over like a pendulum, and the machine regains an even keel

In the first test the surfaces (which are of special paraffin-costed silk) were very loose owing to for and dampness, and once the machine was in the air it was neces-sary for the svintor to sit well over to the left side, in order to counterbalance a difference in lifting power of the two sides of the machine The hinlane rose readily after a run of about 85 feet The machine is said to have lifted at a The machine is said to have lifted at a speed of about 22 miles per hour. The horizontal rudder was turned too far and the machine shot up to a height of 40 feet at an angle of nearly 30 degrees. 40 feet at an angle of nearly 70 degrees Mr Herring attempted to make a turn after flying some 300 feet, and the machine turned successfully though a ward at an angle of about 20 degrees from the horizontal and unaking a 40 degree turn He then cut off the spark and descended In alighting the seat was split and a runner and one of the inclined rods were broken According to the inventor, the machine rose in the air with the aviator (who weighs 190 pounds) with a thrust of 140 pounds, and he believes that a thrust of 80 to 85 pounds is sufficient to fly it throttle was not fully opened, and the motor, he thinks developed not more than 9 horse power when the machine was in flight

This biplane is the first scroplane to fly in New England but it is principally noteworthy because of the new method of automatic stability which apparently ems to work fairly well

Herring has replaced the vertical partitions of the Voisin biplane (which connect the main planes at the ends and at various points in between) by the six small triangular fine shown If these small fins placed above the upper plane, answer the purpose as well as do the partitions in the Voisin machine, one can readily see that they offer much less resistance and skin friction to the air, and should make a much faster ma-chine. They form a means of auto-matic stability which is a decided improvement over warping wings or movable wing ting

MUNN & CO., Inc. 561 Broadway, New York City (Continued from page 246.)

One of our illustrations shows the new siplane of Capt T A. Baldwin, the dean of practical American aeronauta. This of practical American aeronauta. This new biplane has a number of original features, thief of which is the method of preserving the transverse stability by means of a single vertical stability rud der placed above the upper plane. This der placed above the upper plane. This rudder is turned about its vertical axis by means of a fork fitting around the aviator's shoulders, as in the Curtiss ma aviator's shoulders, as in the Curtiss ma chine When the acroplane tipe to one side or the other, by leaning to the high side the aviator sets the stabilizing rud-der at an angle to the line of advance der at an angle to the line of advance. This exerts sufficient force to bring the muchine back to a level keel. The new stabilizing rudder is the outcome of .z. periments tried several years ago by the Aerial Experiment Association. It has been tried out by Mr Curtisa, who claims that it worked satisfactorily upon his meehine. his machine

The new biplane has a spread of 28 feet by a fore-and-aft width of planes of 5 feet which makes an area of 280 square feet of the main planes In addition to these there is a small biplane tail (arried on a there is a small oppine tail (arried on a triangular frame extending back from the main planes and mounted upon a light skid. The vertical rudder is placed in the center of this tail which forms in reality the horizontal rudder, since the

reality the horizontal rudder, since the two surfaces are moveable and are used to direct the machine up or down. The arrangement of the power plant and aviators went is just the opposite of the usual arrangement, and is along monoplane lines. The motor is at the front edge of the lower plane and the avi ators seat above the rear edge. The fly wheel of the motor extends below and above the plane. The propeller is placed half way between the upper and lower planes and is driven by chain from the r It is a large, high pitch propeller tween 8 and 9 feet diameter

The peroplane is mounted upon two pneumatic-tired wheels in front and a single skid at the rear. The regular Cur tiss single-wheel control of the rudders is fitted. The machine has had several successful tests upon the frozen surface

of Lake Keuka, at Hammondsport, N Y The latest model Bleriot monoplane known as the "No 11 bis' is shown from the rear in one of our illustrations on page 236. As can be seen at a glance the body of the machine is now complete. covered, while a new form of tall re-embling that of the Antoinette mono plane has been fitted. The horizontal rudder is in two parts hinged at the rear preedge of the tail proper The spread of this new model is 72 meters (236 feet) the wings being about 11 x 7 feet in size and having an area of 12 square meters (1286 square feet) The length of the body has been reduced from 7 to 86 meters (2164 feet) The total body has been raduced from 7 to 66 meters (2164 feet) The total weight is 310 kilogrammes (6826 pounds), or with aviator 832 pounds This means a lift of 646 pounds per square foot of the deeply curved surfaces. The highest lift per square foot hereto fore obtained has been 5 pounds, so M Bieriot has apparently improved his ma chine in this direction although he has not diminished its weight but instead has not diminished its weight but instead heas increased it in order to give it grater atrength. The same 3-yilinder, fan shaped Ausani 55 horse-power alt-cooled motor is used as hevetofore. This motor develops its power al 1 100 revolutions per minute, at whith speed it revolves the \$35 foot Chaurker propeller. The pitch of the propeller is nearly half diameter and the thrust obtained about 200 pounds. This new model is operated the same as his previous machines by a universally jointed control column pushed forward or pulled backward to direct the machine down or up, while it is moved sideways to warp the wings and correct the transverse equilibrium

SIR HIRAM MAXIM'S AMOPTANE authentic details are now available (Couriesed on page 2(8.)

ENGER MOTOR CAR CO., Summer and Gent Streets, Cincinnati, Ohio

(Continued from page 247)
concerning the aeroplane which Bir Hiram Maxim has built at Crayford, Kent England No small degree of se Kent languand to small degree of se-crey has been maintained, but to those who are acquainted with Sir Hiram's theories, it was evident that he would hase the present acropiane on the main principles which governed the design of the remarkable machine which he built and tested at Baldwyn a Park in 1894

The present machine is the outcome of his original researches and of plans developed during the last five or six years but not until 1908 was the veteran mor able to devote himself fully to the planning of a new flying mad the pianning of a new lying machine in the also set himself designing a gasoline motor, as he hold the idea that much of the trouble with the present serropianes was due to the unsulfable on the strength of the piant of the control ortions of the machine as compared with those of the gigantic appar The total width of the new aero plane is 46 feet, while his earlier multi-plane had a span of over 100 feet

Like its prototype, the new aeroplane is of the multiplane type, and is in effect made up of six aeroplanes, each being 6 feet 6 inches in width, fore and being 8 feet 6 inches in width, fore and att The planes are notably thin, and are neatly covered with waterproof slik fabric very tightly laced Prom the central plane spring out two super-posed wings, readed will above it, and no curved as to produce automatic lat eral stability to a very high degree There are balanced rudders fore and aft, and a horisontal steering rudder The Maxim patent davice for varying the nitch of the planes when in fight the pitch of the planes when in flight is utilized. This differs from the Wright varping device The wings are move e direction by a lever wo hand, while a spring controls them in the reverse direction

The engine is mounted between the

The engine is mounted perseen to planes, and behind the pilot, who sits in a low metal-covered compartment with the steering and control wheel in trunt of him This disposition gives a very clear lookout, and at the same time the aviator is better protected from the wind A nighty have reacure is the pro-pelling grar. On the engine shaft is one small screw propeller mounted at the rear of the planes. This screw travels at the same rate as the engine shaft, and serves also as a flywheel are two larger propellers each 11 feet in diameter, mounted higher up between the planes and driven by cables whose tension is controlled by jockey pulleys The small screw and one of the large ones rotate in the same direction, the other large one in the opposite direction This screw is also given a finer p and higher velocity than its companion and in this way its gyroscopic action balances the joint gyroscopic action of the two propellers, which rotate in the reverse direction. This arrangement of In the engine, too, Bir Hiram has shown how closely he has studied shown how closely he has studied wvery phase of the problem. He has selected a special brand of Vickers steel as the material for his 4-yilland 7-blorus power motor, and has been enabled to reduce weight while leaving a good margin of strongth Special care has been given to the extructor and the valves Bir litram claims that his ongite works with far greater regularity and smooth with far greater regularity and smooth ess than the average aerial motor used The engine is fully water cooled and the radiator is mount ed under the upper plane in a manner suggestive of that adopted by Santon magnetive of that adoptes to the property of the property of the property of automatic forced feed inductation is employed, SUING & CO., in., Publisher of Section 1.

# Everyday Magic

Aladdin's lamp transported its owner from place to place in the twinkling of an eye

That was thousands of years agoand the lamp was only a myth But so wonderful that the story has endured to this day

The Bell telephone is far more wonderful-and it is a reality

It is the dream of the ages, come true. In the office, in the home it stands, as commonplace in appearance as Aladdin's lamp

By it the human voice-the truest expression of personality, ability, and character-is carried from place to

place instantly and accurately And human powers are thus extended as if by magic

All other means of communication are cold and colorless in comparison. By the telephone alone is the human quality of the human voice carried beyond the limitations of unaided hearing.

The Bell System has provided this wonderful faculty for all the people.

The whole country is brought together by the Bell policy of universal service, and the miracle of telephone talk is repeated six billion times a

The Bell Long Distance telephone puts a man in intimate touch with new resources, new possibilities.
One Policy, One System, Universal Service—these
make every Bell Telephone the Center of the System.

MERRI & CO., Inc., Publishers SEI Reselver, Herr York

(Concluded from page 248.)
which carries oil to every working part
of the engine in a very effective manner.
Indeed, the new motor promises to set a splendid example in aeroplane engi-neering, for it shows that, by skillful designing and the choice of suitable ma-terial, a light motor can be built with all the refinements which are now usual all the refinements which are now usual-ly fitted to high-grade engines for motor-car work The spasmodic action of many aeroplanes at present in use is due largely to the fact that their engines

are unreliable

The new Maxim aeroplane is mounted on wheels fitted with nest shock absorbers. Regarding the machine as a whole, its clean lines and uncommon aswhole, its clean lines and uncommon as-pect are the most striking features. There is a noteworthy absence of the complication of stays, guy wires and framework, which on many biplanes cause so much head resistance. The grouping of the various organs has been very skillfully done, and as far as ocen very skillrolly done, and as far has possible those paris which set up most resistance are set in the same lines, one behind the other, thus minimizing wind resistance in effect the whole machine bears evidence of remarkable originality, bath in its except form and for its machine in the property of the property both in its general form and in its main details. Sir Hiram does not yet pro-pose to test it in free flight, as he has built an apparatus like that designed by the late Capt Ferber, whereby the ma-chine can circle in a captive state around a steel mast. When so many other ma-chines, however, are experimented with in free flight by aviators of small ex-perience, the Maxim method may not seem altogether necessary, although with a striking new type of machine it is undoubtedly a very sure course of pro-

cubic variate from excavation and 7,200,
000 cubic yards of embankment and refilling. The plant of the contractor at
the Olive Bridge dam consists of four
cableways, about 95 feet in height, which extend across the valley above the dam with a clear span of 1,530 feet. The crushing plant, with a capacity of 200 tons of crushed stone per hour, and the concrete mixing plant are located con veniently to the work, the material being brought below the cableways, by which it is deposited as desired along structure Work was begun in the fall of 1907, and at the present time about 25 per cent of it has been completed

per cent of it mass been completed.
The total length of the aqueduct
(which is 17½ feet wide by 17 feet in
height) from the Ashokan reservoir to
the city line is 92½ miles, and its cost
will be about \$45,000,000. To render the work perfectly secure and perman ent, wherever the aqueduct encounters streams or rivers of any magnitude it a carried beneath them either by deep is carried beneath them either by deep pressure tunnels, or by sized and con-crete pipes. The most notable pressure tunnel will be that below the Hudson River In some respects this is the most interesting feature of the work, and we are informed by Mr Alfred D. and we are informed by ar Alived D Filing, Department Engineer of the Board of Water Supply, that the borings have revealed at great depth a granite rock emissionly suited to carry this great and important conduit. In addition to a vertical boring made from a barge at the center of the river, which has reached a depth of 708 feet, two diagonal borings have been made one from either shore of the river That from the east snore of the river runs from the east orn shore descends at an angle of 44 degrees for a distance of 1907 feet, where it has reached a point 70 feet where it has reached point 70 feet from the coater of the river From the form the coater of the river From the first of the river From the in degrees, another boring has been driven for 1760 feet, which is now with in 130 feet of the center of the river The vertical shafts are now being such on either shore; they will be carried down to a depth of 1,000 feet below mean high-water level of the Hudoma River at (Outcombided on page 300.)

A CHRAP LAYRE UPON WRICE VALUARIE WORK CAN HE DOEE for mubbert of an article contained in Re American Supplement 1988.

Rands number of the Scientific American plement costs 10 cents by Hall. MURIN & CO., Inc., 361 Breadway, New York (Concluded from page £16.)
this point At that depth they will be
connected by a horisontal tunnel. The
aqueduct passes through the mountains, addeduct passes varough the mountains, and reaches the westerly shore of the Hudson River at an elevation of '460 feet above tide level, and here vertical and horizontal shafts will connect with the 1,200-foot deep shaft at the imm ate edge of the river, making a total depth of 1,600 feet from the flow line to the lowest level of the siphon. It is gratifying to realize that after the doubts and anxieties regarding the guo-

logical conditions affecting this work, its construction in solid granite has been

assured it should be mentioned that the whole siphon will be liued through

out with concrete out with contrete

At Kensico there is being built an
auxiliary storage reservoir of about 40
billion gallons ultimate capacity, of
which about 20 billion gallons will be available at flow line level. The elevation available at flow line level. The elevation of the discharge will be 356 feet above mean tide. At Searsdale 4 miles south of Knsice, will be a large fittration plant, and at Hillview, 6 miles to the south of this will be built another storage reservoir with a capacity of 390 million gal. lons, the discharge being 295 feet above

The Kensico dam, which will be built scross the valley of the Bronx, will be a masonry structure 290 feet high and

1830 feet long From the Hillylew reservoir water will be carried to the several boroughs of the city in a pressure tunnel excavated deep down in the rock beneath the boroughs of Broux and Manhattan and under the Harlem and East Rivers, to s point in the heart of Brooklyn, who will be brought to the surface and continued in metal pipes, one branch lead ing north to the borough of Queens, and the other passing below the Narrows to Richmond at a point where the width is about 10,000 feet. The construction of this tunnel will confer the inestimable this tunnel will confer the inestinable advantage that even at the lower end of Manhatian the water will rise to a height of 250 feet above sea level, or say to about the top of a 20-story building. The total cost of the work from and including Ashoxan dam to the city line, all of which is now under contract is

\$69,094,870, and of this amount work to the value of \$10,000,000 has been com pleted The total cost of the whole scheme when all the watersheds have been developed, will be \$163,000,000

# IONIZATION OF AIR

IONIEATION OF AIR
(Confinue if your page 245)
The metal becoming tharged gives a
greatly enlarged shadow
The ions travel in a strong electric
field at the rate of several thousand feet per second, and it is not the air which per second, and it is not the air want conveys the charge, although it is dragged along by the ions in the same manner as it is by a jet of water. This can be demonstrated very easily by directing a blast of air at right angles to the path of the ions. Scarcely any deflecin Fig 7 is shown the image of an eb-onite rod and a glass tube produced in the manner already described. The next the manner aiready goacribed. The next illustration represents the same objects with a strong blast of air thrown athwart the rourse of the lons. The effect of the blast is only shown issuing from the tube-just beneath the rod. Otherwise the re-sult as oxacily the same as if there were

The experiments may be varied within a very wide limit, and an interesting variation is to use, instead of the shoults thest, a plate of metal well insulated and connected to the other pole of the elseconnected to the other pole of the sloc-trical machine, instract of exarching the pole as previously déscribed. On aboset of metal lay a piece of paper, and upon this sprinkle filings preferably as mixture of magnesium and based tros oxide. Between the sheet and the dis-fers, such as the cross, and when the (Concluded on, pages BEL)

SPARK COILS Their Construction Simply Explained

1887 describes a 4-inch spark coll and conconstantial. American Supplement 1
1468 gives data for the construction of only of a deletic bength of spark. The above-mentioned set of seven papers will be supplied for 70 ccmts. Any single copy will be mailed by 10 cts. MURN @ CO., Inc., Publishers 541 Breadowry Row York.

(Concluded from page 200) ectrical machine is set in action the filings will disappear from under the eb-onite cross, giving a well-defined image, as shown in Fig 9

In the early part of this article it was pointed out that the electric discharge would not pass through perforated zine under the circumstances there prevailing But it can be made to do so To bring about this result place a plate of metal connected to the second pole of the ma canne seneral rae countre speet in such as way as to bring it opposite the discharge polut A in Fig 12 Sprinkle the surface of the chonite sheet with the powdered red lead and sulphur, and in powdered red lead and sulphur, and in terpose an earth d short of perforated zine or a metallic sleve between the dis-charge point and the chonite. When the electrical machine is set in action a per feetly defined image of the perforations of the zinc obstacle will be obtained upor the ebonite sheet as shown in Fig II If the plate condenser with its connected sides of tinfoil, mentioned previously is used, the passage of the lons through used, the passage of the ions intolign the perforations may be ascertained by the sparks jumping across the narrow gap. The explanation is that under the conditions described the electric field extends uninterruptedly from the point of discharge to the insulated metallic plate, so that the perferated sheet is in a per

fectly neutral condition and scarcely in tercepts the ions. Several other striking and interesting methods of ionizing air can be carried out, such as by a flame white-hot met als, electric sparks, and so on One of the most impressive is that showing that ionization is produced by ultraviolet rays falling upon zinc if a plate of rays failing upon time. If a plate of clean lane connected to a gold leaf electroscope be negatively electrified and it measures to be upon the control of the clean lane leaf to be tween aim electrodes it is rapidly discharged If the charge in positive, the phenomenon will not be produced, the experiment will also serve to show that these negative tous follow the discharged III also serve to show that these negative tous follow the Court of the capture illustration, Fig 13 shows how to carry out this experiment. The tinfoil backing of the ebonite plate is connected to the positive pole of the mashine Opposite this plate and parallel therewith is placed a sheet of zinc, connected to the negative pole of the machine leaving a clear width of about three inches between the two plates. The zinc plate is illuminated by the ultra violet light from the zinc are light for about a minute Under these circumstances the lines of force run perpendicularly between the two plates, and if any design is painted In varnish upon the zin plate, the emis-sion of ions from that portion of the sine will be arrested and a reverse in age of the design will be obtained on the ebonite plate when subsequently dusted with the powdered red lead and

The experiments of Sainte-Claire De ville and Caron apparently proved that the Oriental sapphire owes its beautiful color to the presence of a minute quantity of chromium in a state of oxidation lower than that which corresponds to the ses quiexide. It has not hitherto been found possible to reproduce the blue color with the aid of chromic oxide and reducing agents, nor yet to obtain by fusion in the oxyhydrogen fiame, artificial sapphire colored by traces of oxide of iron If however, a small quantity of titanic acid is added together with the oxide of iron, the reduction of the acid to titanium ox the reduction of the acid to illanium ox ide takes place to such an extent that the mass fuses and assumes the fine blue color of the sapphire This result has been obtained by Verneuil, who is of the peen obtained by verneuli, who is of tim-opinion that in addition to sapphire col-ored by oxide of chromium there is an other variety which owe its color to ox idea of iron and titanium. We have seen specimens of those artificial sapphires and to as they seem as beautiful as those of

1. The Haynes at \$2,000 looks "too good to be true"

Nothing like it has ever been offered before Cars with
practically no reputation cost as much

2 The best way to prove its value is to compare it, point for point, with cars selling for \$2,500, \$3,000, \$3,500, or even more. Judge for yourself.

# \$2,000—With Full Equipment

3 Take the advice of other manufacturers and investigate everything they have to offer. Haynes cars at \$2,000 are more than equal to any comparison

4 Don't buy it merely because it is made by America's pioneer automobile manufacturers. Buy it because there is nothing to compare with it at \$2,000.

Roadster Dems-Tonneau or Touring type-all at the same price Let us send you the Haynes book and tell you where you can get

THE PRESERVATION OF THE CITY HALL PARK. T is a positive misfortune that the lack of a co-ordinated plan coupled with the astounding rapidity with which the city has been built up. to say nothing of a total want of foresight on the part of the municipal authorities should have robbed the metropolis of the New World of the oppor tunity to present those aggregations of magnificent municipal hutidings, grouped about spacious and care-fully laid-out plazas and public squares, which are one of the glories of the great cities of the Old World Buch public spaces as we possess have been gradually encroschod upon and their intended vistas have beer closed and too often positively disfigured, by build-ings of no architectural heavy which have been run up apparently without any appreciation and extainly with a total disregard of the architectural oppor

tunities thus presented and so ruthlessly thrown away.

Perhaps the best known of our public squares is City Hall Park which early in the last century, was beautified by the erection of that gem of municipal architecture the City Hall a building which even at are incentive in City Init a unitality when even at this late day maintains its position untailinged as the most perfect piece of work of its kind in New York if not in the whole of the Inited States. For the greater part of a century this chashe building was pis-tically the sole occupant of the park and, standing in the midst of its green haves and surr though not obscured by an adequate growth of tim ber, this beautiful structure long remained as the dominating feature of what is certainly the most in teresting and in some respects the most beautiful of our smaller city parks

The first descration of this spot occurred when the Federal government erected at the apox of the tri angle that unsightly pile which for several decades done duty as the General Post Office, a building which not only entirely shuts out the charming view of (By Hall and the Park which was formerly obtain able from Broadway but constitutes in likelf a monu ment to the total lack of refinement which marked the public architecture of the day in which it was built.

And now it is proposed not only to further encroach apon the aiready restricted area of the park by ing thereon a County Court House of colossal dimen sions but it is intended, if you please to place this siructure immediately behind the City Hall, whose just proportions and delicate beauty will be entirely dwarfed and ruined by the towering and widely over inpping façade of the building Although it may be a palliation it is certainly not a justification of Mayor Gaynor and the other city officials who favor this course, to state that they do so unwillingly and after a sincere endeavor to secure some other suitable site. For there is a possible though very costly, escape from the dilemma by means of the alternative in which originated with the architects of this city and is receiving the indorsement of the leading artis tic municipal improvement, and historical societie to say nothing of a thoroughly unanimous public pres cieties This proposal is that the city purchase the two blocks lying immediately to the north of the City Hall and place the m w Court House upon the land so secured the various departments being housed in the office and other buildings now covering this land until such time as the new Court House is ready for occu-pancy. As the needs of the city demand it and the funds become available the land so acquired would be covered with other municipal buildings of a monumen tal character, and ultimately this group of buildings, and the City Hall Park with the present historic structure would form an important center with landscape and architectural effects of dignity and beauty that would be commensurate with the importance of a city which is destined ultimately to become in size wealth, and importance the leading city of the world,

# Scientific American

In giving our hearty indersement to this proposal, we are not unmindful of the fact that New York city has now in contemplation public works on an enormous scale involving the expenditure of vast sums of mous scale involving the expenditure of vast sums of money But we also realize that in municipal as in other affairs, conditions may occasionally arise in which sacrifice on the part of the present generation, large as it may appear at the time, may come to be regarded by posterity as but a small price to pay for the lasting benefits conferred.

The present crisis surely presents an opportunity of

this very character

### THE MEYER HAVAL RECOGNISATION TO HAVE A PAIR TRIAL

N view of the diversity of opinion which developed at the hearing of the House Naval Committee that body followed, we think, the wisest course in failing to recommend any legislative action until Secretary Meyers plan has been in operation for a summent length of time to prove the extent of its practical utility. As to the wisdom of some of the changes which the Secretary has made, there can be no possible difference of opin-ion. The institution of a separate and independent Bureau of Accounting is one of the best reforms that have been introduced into the navy for many a decade, and already at the Boston yard, where it has been for a considerable time in operation, the system has

shown very satisfactory results
